# DD. DADES GENERALS

## DD1. IDENTIFICACIÓ I OBJECTE DEL PROJECTE

**Títol del projecte:** Projecte d'execució d'una piscina descoberta al municipi de Llinars del Vallès.

**Objecte de l'encàrrec:** L'objecte es redactar el projecte de les noves piscines exteriors i instal·lacions a Llinars del Vallès.

**Emplaçament:** Avinguda Pau Casals, 281, 08450 Llinars del Vallès (Barcelona)

## DD2. AGENTS DEL PROJECTE

### Dades del Promotor

**Nom:** Ajuntament de Llinars del Vallès.

**Identificació:** P-0810500I

**Adreça:** Plaça de la Vila, 1, 08450 Llinars del Vallès (Barcelona)

**Telèfon:** 938412750

### Dades del Projectista

**Nom:** Ingeniería y Sistemas Integrales, S.L.

**Identificació:** CIF B-62311725

**Adreça:** Carrer de Valéncia número 208 2n 1a, 08011 Barcelona

**Direcció electrònica:** isisl@coac.net

**Representant:** Laia Roca i Berlanga

**Titulació:** Arquitecta

**Núm. col·legiat:** 28.076-3

# MD. MEMÒRIA DESCRIPTIVA

## MD 1. INFORMACIÓ PRÈVIA: ANTECEDENTS I CONDICIONS DE PARTIDA

El terreny està situat a l'Avinguda Pau Casals, 281 de Llinars del Vallès. Per una banda, té el carrer Tossa com a límit a l'Est i a l'Oest l'Esportiu de Llinars. Aquest centre és un poliesportiu que integra una gran varietat de sales i espais de fitness, una piscina de 25 metres, pistes de pàdel i pistes de tennis. Per una altra banda, al nord d'aquest terreny hi ha un altre terreny sense edificar i amb un gran desnivell topogràfic.

El solar objecte del projecte és de forma irregular i actualment es troba sense edificar. Té una disposició en forma de L amb una àrea entre el poliesportiu i el Carrer de Tossa i una altra àrea més gran entre la zona del darrera del poliesportiu i el solar sense edificar. L'àmbit ve delimitat pel tancament del poliesportiu existent i el talús que genera el desnivell del solar veí.

L'accés al solar es genera des del petit tram del solar que es troba a la mateixa avinguda Pau Casals i també es podria generar pel carrer Tossa, no obstant, aquest es troba en cert desnivell. Els sols inclosos dins l'àmbit tenen un desnivell màxim d'uns 3 metres, tal i com es pot observar a la documentació gràfica. No obstant, el solar contigu es troba a una cota superior, exactament a 5 metres per sobre, fet que genera un gran talús.

Al ser un solar sense edificar no es disposa de serveis existents, però, es desconeix si hi podria haver possibles afectacions a altres serveis existents, com xarxes de clavegueram, xarxa elèctrica, etc.

Les actuacions necessàries prèvies realitzades per tal de poder fer un correcte reconeixement i execució del projecte, han estat:

- Aixecament topogràfic 1:200 entorns zona l'esportiu de Llinars del Vallès.
- Estudi geotècnic. Nova piscina municipal. Avinguda Pau Casals nº281 Llinars del Vallès Barcelona. Informe nº 1254/11/24.

Aquests dos documents serveixen per tenir les preexistències físiques i geològiques del terreny. Per tant, s'adjunten en el present projecte com annex 1 i annex 2.

Així doncs, l'esmentat projecte executiu defineix una proposta que engloba la urbanització del solar mitjançant la construcció de les dues piscines i l'edificació de les volumetries dels vestidors, recepció i bar amb la conseqüent urbanització dels entorns.

## MD 2. DESCRIPCIÓ DEL PROJECTE

### MD 2.1 DESCRIPCIÓ GENERAL DE L'EDIFICI

El terreny objecte del present projecte es troba dividit entre dos parcel·les diferents, les quals s'enumeren a continuació segons referència cadastral:

- Referència cadastral: 8900803DG4180S0001MO

  Localització: Av. Pau Casals, 281 N2-283, 08450 Llinars del Vallès (Barcelona)

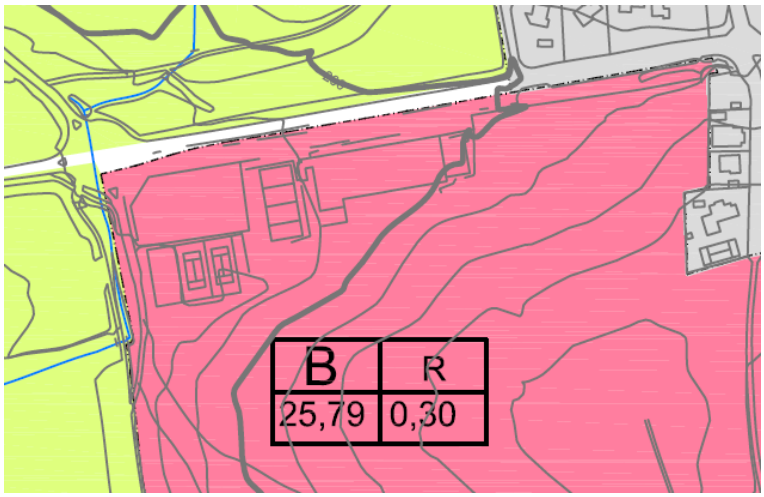
- Referència cadastral: 8900801DG4180S0001TO

  Localització: Carrer Bonavista, 146 N2-148, 08450 Llinars del Vallès (Barcelona)

La delimitació del solar, tal com s'ha definit anteriorment, es troba entre el carrer Tossa i l'Avinguda Pau Casals, serà aquesta última la que donarà accés al complex, per tal de donar façana al carrer principal, així com també donar continuïtat al complex esportiu existent.

S'entén que l'eficiència energètica de l'edifici comença amb el plantejament volumètric del mateix. Per tant, es realitzaran un seguit de mesures, com per exemple la ventilació creuada que minimitzaran els requeriments energètics pel funcionament de l'edifici.

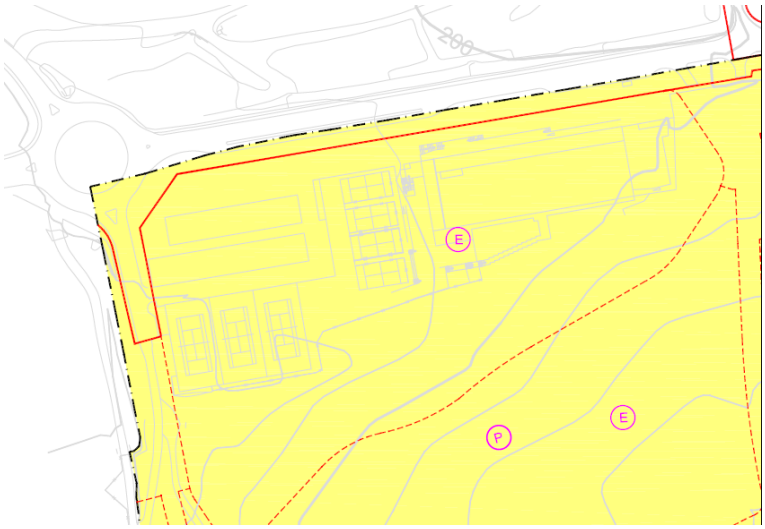
Malgrat els diferents nivells del solar, l'edifici s'ha configurat per tal de garantir els recorreguts accessibles a tots els usuaris. Totes les dependències consten sempre de recorreguts i espais adaptats per a usuaris amb mobilitat reduïda i d'aquesta manera sigui un equipament inclusiu i d'ús universal.



La proposta planteja la creació de dues piscines, una de 25x12,5 metres i l'altra de 10x10 metres, així com uns vestidors, una zona de recepció i oficines, una petita sala de neteja i un bar. A l'hora de dissenyar els diferents edificis s'ha plantejat com a criteris generals, la funcionalitat i aportar el màxim de recursos naturals als espais interiors com la il·luminació i ventilació natural per tal de garantir el màxim confort als usuaris.

## MD 2.2 JUSTIFICACIÓ DEL COMPLIMENT DE LA NORMATIVA URBANÍSTICA

El present projecte vol adequar al marc legal d'aplicació dels diferents àmbits com la normativa urbanística sobre el planejament i les ordenances.



Així doncs, segons el Pla General d'Ordenació Urbana (PGOU) de Llinars del Vallés aprovat definitivament i posteriorment publicat al D.O.G.C. el 14 de maig del 2003 i plànols actualitzats a data 13 de juliol de 2015 i 16 d'octubre de 2015, el solar del present projecte té les següents característiques.

Classificació del sòl i usos globals:

- Tipus de sol: Sol urbanitzable
- Sector: B
- Ús global: R Residencial
- Edificabilitat Bruta del sector: 25,79
- Superfície del secor en Ha: 0,30

Zonificació del sòl urbà:

- Sol urbanitzable residencial
- Sistemes: clau E (equipaments)

Es tracta d'un projecte de gran abast que ha de contemplar els diferents requisits normatius. Pel que respecta a la normativa urbanística segons el Pla General d'Ordenació Urbana (PGOU) de Llinars del Vallés redactat el maig del 2003 ens indica que l'àmbit d'actuació del present avantprojecte segons el règim de sol i la seva classificació pertany a sol urbanitzable i clau d'equipament. Així doncs, es dona compliment amb el nou ús que si li vol donar al solar que és el d'equipament de piscines municipals.

## MD 2.3 DESCRIPCIÓ DE L'EDIFICI. PROGRAMA FUNCIONAL

En el present apartat s'explica el conjunt del projecte, tant l'edifici com la zona de piscines i tot l'àmbit a urbanitzar que conforma el complex esportiu. Així doncs, a l'hora de realitzar la configuració general de tot el complex s'han tingut en compte els recorreguts dels usuaris, la integració en l'espai natural, així com també l'optimització dels recursos, per tal de donar la millor disposició possible a noves instal·lacions esportives.

D'aquesta manera, l'edifici ve determinat per la generació d'un primer volum que conforma la façana a l'avinguda principal Pau Casals i el qual recull l'espai de recepció i oficines de tot el complex. Una vegada dintre de les instal·lacions esportives, la generació d'un espai verd és el que determina el recorregut cap als torns, per tal de determinar l'accés i passar el control.

Primerament hi ha un volum de recepció i oficines que dona façana al carrer principal i determina el control i l'accés del usuaris.

Seguidament, els dos vestidors (femení i masculí) són dos volums independents que a través d'una pèrgola entre el volum i el talús que genera el desnivell del solar es conforma el recorregut a l'accés de peus-bruts del vestidor. La distribució d'aquests està constituïda amb les zones humides que són: un bany, un bany adaptat, dos rentamans i cinc dutxes (una d'elles adaptada). La sortida amb peus-nets es realitza cap a la zona verda que determinava l'inici del recorregut. Així és genera una confluència entre el buit i el ple i entre el paviment tou i el paviment dur.

Per últim, en un quart volum, es troba el bar, el qual disposa de la terrassa cap a l'espai exterior de les piscines. La urbanització de les piscines ve determinada per l'eix d'alineació de la parcel·la i la generació de paviment dur. Primerament es troba la piscina gran de 25 m de llarg i 12,5 d'ample i, alineada a ella, la piscina petita quadrada de 10 metres de costat. Les piscines disposen de la seva superfície de platja que al mateix temps, en el centre d'elles, s'ubica al subsòl la sala de màquines i els dipòsits de compensació,

necessaris per al bon funcionament de les piscines. L'accés a les piscines es pot realitzar a través de rampes amb pendent accessible per tal d'invitar a l'accés i que sigui un recorregut completament adaptat.

Finalment, la resta de parcel·la s'entén com un espai verd i d'esbarjo per als usuaris que acaba delimitant amb la parcel·la veïna i un seguit d'arbrat que genera un fons de vegetació a totes les instal·lacions esportives.

Pel que fa al programa funcional es descriu i detalla a continuació:

- Recepció amb dos llocs de treball.
- Despatx per a la persona responsable i la recepció de possibles visites.
- Dos vestidors. Cadascun dels vestidors té: 5 dutxes, 3 rentamans, 2 inodors i entre 20 i 23 metres lineals de banc.
- En cadascun dels vestidors és disposa de dutxa, rentamans i inodor adaptat, per tal de garantir l'accessibilitat i l'ús inclusiu de les instal·lacions.
- Sala de neteja amb un abocador.
- Armari per a la ubicació d'instal·lacions.
- Bany format per inodor i rentamans per als treballadors de les oficines i recepció.
- Dos banys exteriors destinats a piscina formats cadascun d'ells per rentamans i inodor.
- Espai de bar amb magatzem, cuina i zona de barra.
- Terrassa per a la zona de bar.
- Sala instal·lacions i/o zona de magatzem.

La proposta d'actuació es veu reflectida a la documentació gràfica.

### MD 2.4 ZONA DE L'EDIFICI ON ES FA L'ACTUACIÓ

## Descripció i identificació:

L'actuació es realitza en tot l'edifici, inclòs l'arranjament exterior, el qual s'ha explicat a l'apartat anterior. Tot i que la descripció i identificació de les zones queda explicitada en la documentació gràfica del present projecte, s'explica detalladament en els següents apartats.

A continuació es dividirà la relació de superfícies per espais:

| EDIFICACIÓ | SUPERFÍCIE ÚTIL |
|---|---|
| **EDIFICI OFICINES** | |
| Recepció | 6,20 $m^2$ |
| Oficines | 10,45 $m^2$ |
| **SUPERFÍCIE ÚTIL** | **16,65 $m^2$** |
| SUPERFÍCIE CONSTRUÏDA | 19,79 $m^2$ |
| | |
| **EDIFICI VESTIDOR 1** | |
| Vestidor 1 | 66,19 $m^2$ |
| Servei oficines | 1,34 $m^2$ |

| | |
|---|---|
| Sala de neteja | 1,71 m² |
| Armari elèctric | 2,06 m² |
| **SUPERFÍCIE ÚTIL** | **71,30 m²** |
| SUPERFÍCIE CONSTRUÏDA | 79,40 m² |

| | |
|---|---|
| **EDIFICI VESTIDOR 2** | |
| Vestidor 2 | 67,47 m² |
| Servei Piscina 1 | 2,09 m² |
| Servei Piscina 2 | 2,09 m² |
| **SUPERFÍCIE ÚTIL** | **71,65 m²** |
| SUPERFÍCIE CONSTRUÏDA | 81,02 m² |

| | |
|---|---|
| **EDIFICI BAR** | |
| Bar | 9,29 m² |
| Cuina | 7,25 m² |
| Magatzem | 5,00 m² |
| Sala d'instal·lacions/ Magatzem | 6,64 m² |
| **SUPERFÍCIE ÚTIL** | **28,18 m²** |
| SUPERFÍCIE CONSTRUÏDA | 34,42 m² |

| | |
|---|---|
| **SALA DE MÀQUINES** | |
| Vas compensació 1 | 12,40 m² |
| Vas compensació 2 | 4,00 m² |
| Sala màquines | 66,,44 m² |
| **SUPERFÍCIE ÚTIL** | **82,84 m²** |
| SUPERFÍCIE CONSTRUÏDA | 100,00 m² |

| | |
|---|---|
| **TOTAL SUPERFÍCIE ÚTIL** | **270,62 m²** |
| TOTAL SUPERFÍCIE CONSTRUÏDA | 314,63 m² |

| | |
|---|---|
| **URBANITZACIÓ** | |
| Piscina gran | 312,50 m² |
| Piscina petita | 100,00 m² |
| Distribuïdors i platges | 719,38 m² |
| **TOTAL URBANITZACIÓ** | **1.131,88 m²** |

### MD 2.5 CRITERIS DE PROJECTE

La pauta seguida per la confecció d'aquest projecte executiu de les piscines de Llinars del Vallès ha consistit en l'anàlisi exhaustiu de les problemàtiques i mancances actuals per tal d'obtenir solucions eficaces i realistes.

Al llarg de la redacció del projecte també s'ha mantingut la rigurositat tècnica i normativa i s'han ajustat els càlculs i els dimensionaments a les necessitats reals, per tal de reduir el preu i evitar el sobre cost.

Alhora, en tot moment s'ha tingut en compte l'ergonomia tant dels usuaris com dels treballadors, la sostenibilitat del medi ambient i la reducció de l'impacte ambiental de l'actuació.

Per tal d'arribar a aquest punt s'ha realitzat la selecció dels equips i mecanismes amb millors prestacions i característiques d'alta eficiènca. Les bombes de circulació tenen un rendiment del 70% i les lluminàries

escollides són tipus LED per a una eficiència més alta. Amb totes aquestes mesures s'aconseguirà una reducció del consum i una millor eficiència energètica.

Finalment, la premisa principal és la formació d'unes noves piscines municipals que englobin la idea d'ergonomia, d'accessibilitat i sostenibilitat per tal de que els usuaris de les instal·lacions puguin gaudir d'un equipament construït de manera eficient, inclusiva i respectuosa amb el medi ambient.

## MD 3. DESCRIPCIÓ GENERAL DELS SISTEMES

Les característiques generals dels sistemes que composen l'edifici és dividiran amb: la urbanització i l'edificació, així doncs es separaran aquests dos punts, per tal de definir-los acuradament.

Primerament pel que fa a la urbanització, es procedirà al pertinent moviment de terres per tal de realitza el buit i el ple de la parcel·la. Per optimitzar aquest punt, s'ha considerat la millor ubicació de les piscines per tal d'acotar el moviment de terres i intentar aprofitar-les dintre de l'obra. La construcció de les piscines i les seves sales de màquines es realitzarà amb murs de formigó armat per tal de contenir les terres adequadament. Pel que fa als paviments exteriors es considera tot l'arranjament exterior mitjançant zones toves que s'executaran amb gespa i zones més dures amb paviment de classe 3 per tal de que sigui antilliscant i segur per als usuaris.

Pel que fa a les instal·lacions de les piscines es considera tota la distribució de fluids i les depuracions de les dues piscines, les quals es trobaran soterrades annexes a aquestes, tal i com s'ha anomenat anteriorment. També s'instal·laran les dutxes exteriors, l'enllumenat i la instal·lació d'electricitat amb la seva correcta posada a terra.

Seguidament pel que fa a l'edificació es realitzaran els moviments de terres que siguin necessaris. Els nous volums s'executaran amb blocs de formigó estructurals i fonamentació superficial tipus sabata correguda o llosa, segons resultat de l'estudi geotècnic. Pel que fa a l'acbat exterior dels volums seran de blocs de formigó vistos i els revestiments interiors seran amb arrebossat i enrajolat ceràmic fins a una alçada de 2,10 metres i la part de sobre s'enguixarà i pintarà.

D'altra banda, respecte a les instal·lacions es realitzarà la xarxa de sanejament pertinent connectada a la xarxa pública. Es contempla la xarxa de fontaneria de coure aïllada o de polipropilè segons traçat que vindrà des de la xarxa pública. La producció d'ACS és realitzarà mitjançant acumulador tèrmic elèctric. També es contempla el sistema d'il·luminació tant exterior com interior de tot el complex. A més, s'instal·laran diferents quadres per separar els diferents espais i usos, juntament amb les respectives proteccions. No es contempla climatització i pel que fa a la ventilació, com ja s'ha anomenat anteriorment es realitzarà mitjançant ventilació natural creuada i la zona de dutxes a través d'un ventilador axial i un sistema de conductes amb reixetes com a elements verticals. També es contempla dotar la instal·lació amb equips contra incendis per tal d'adequar el complex de possibles adversitats.

# MC MEMÒRIA CONSTRUCTIVA

## MC1. DESCRIPCIÓ DELS SISTEMES QUE COMPOSEN L'EDIFICI

A continuació s'indiquen les diferents actuacions que es realitzaran a l'edifici:

**TREBALLS PREVIS I ENDERROCS:** tenim l'enretirada de possibles elements en el terreny i el desmuntatge del tancament metàl·lic existent. Primerament, es talarà controladament els arbres mitjançant grua, retroexcavadora i mitjans manuals. Seguidament, s'enderrocarà un tancament exterior. D'una banda, es realitzaran diverses excavacions de terres de diferents alçades per a la homogeneïtzació i aplanament del terreny fins a cota de 200 metres. A la futura localització de la piscina gran es realitzarà una excavació més profunda per tal d'ubicar els vasos d'una profunditat compresa entre 1,20 i 1,40 metres piscina gran i 0,40 piscina petita. D'altra banda, a la zona del terreny a nivell més baix es durà a terme un replè per assolir la cota de 200 metres, per tal de que sigui homogènia en tot l'àmbit del projecte. Finalment, es realitzarà una excavació de rasa de 60 centímetres d'amplada i 1 metres de fondària per al pas d'instal·lacions. Aquesta tindra afectacions en el paviment de la vorera i el vial d'accés.

**ACCESSIBILITAT:** es disposarà de dos passamans superiors a cada piscina a una alçada compresa entre 0,90 i 1,10 metres i dos passamans inferiors d'entre 0,65 i 0,75 metres amb una amplada d'entre 90 centímetres i 1 metre pel pas de persones amb mobilitat reduïda. Cada vestuari tindrà el respectiu servei higiènic adaptat amb vàter i pica adaptada, a més de barres horitzontals de 70 centímetres de longitud situades a una alçada de 75 centímetres i espais de transferència per a cada element dels serveis accessibles. També, cada vestidor disposarà d'una dutxa adaptada amb cadira per a dutxa, espai de transferència en serveis accessibles en dutxa i barra horitzontal en forma de L i una barra vertical amb un punt de recolzament. Els espais dels vestuaris i accés estan dissenyats per espais de gir de diàmetres de 1,50 metres, per tal de que siguin accessibles.

**SISTEMA ESTRUCTURAL:** referent al sistema estructural dels diferents edificis s'adjunta a l'apartat corresponent.

**DIVISORIES:** pel que fa a l'envolvent exterior, les façanes exteriors i les parets interiors estan formades per parets estructurals de bloc de formigó armades de dues cares vistes. Aquestes parets segons càlculs tenen gruixos de 15 centímetres i de 10 centímetres segons càlculs. Les parets seran de bloc foradat de morter de ciment llis, de 400x200 mil·límetres, de cara vista gris. Col·locada amb ciment pòrtland amb traves i brancals massissats amb formigonament per a fàbrica de blocs de morter de ciment, amb formigó i armat amb acer en barres corrugades. Els calaixos dels baixants d'aigües pluvials seran d'obra ceràmica, col·locat amb morter. Totes les cantonades aniran protegides amb arestes amb cantonera.

**REVESTIMENTS:** L'interior dels vestidors i dels banys anirà arrebossat reglejat sobre els paraments amb morter i enrajolat amb rajola ceràmica premsada esmaltada mat, rajola de València, col·locada amb adhesiu cimentós i rejuntat amb beurada fins a 2,1 metres d'alçada i la part de sobre s'enguixarà i pintarà amb pintura amb baix contingut de dissolvents, de color, amb una capa d'imprimació específica i dues capes d' acabat de color a escollir per la Direcció Facultativa (DF). Seguidament, la recepció i les oficines s'enguixaran reglejat i pintat amb pintura amb baix contingut de dissolvents, de color, amb una capa d'imprimació específica i dues capes d' acabat de color a escollir per la DF.

**FALS SOSTRE:** els vestidors només tindran una la zona de l'accés amb cel ras, ja que s'instal·larà un acumulador tèrmic elèctric i un ventilador lineal de conducte. Per tant, es formarà un calaix amb plaques de guix laminat tipus hidròfug de 12,5 mm de gruix, col·locades amb entramat estructura senzilla d'acer galvanitzat format per perfils col·locats cada 600 mm fixats al sostre mitjançant vareta de suspensió cada 1,2 m. El cel ras serà de de placa de guix laminat hidròfuga i gruix 12,5 mm, amb vora afinada amb entramat estructura senzilla d'acer galvanitzat format per perfils col·locats cada 600 mm fixats al sostre mitjançant vareta de suspensió cada 1,2 m i pintat de parament de guix amb pintura plàstica amb acabat llis, amb una capa segelladora i dues d'acabat de color a escollir per la DF. D'altra banda, la resta de sostres de les diferents volumetries es pintarà amb pintura plàstica amb acabat llis, amb una capa de fons diluïda i dues d'acabat de color a escollir per la DF.

**PAVIMENTS:** el paviment tant de l'exterior com de l'interior de les volumetries, de la zona superior de les piscines, la rampa i parets de la piscina gran i paret de la piscina petita serà el mateix: paviment ceràmic. La resta de les parets i paviments de les piscines seran de les mateixes mides i model però de color diferent.

**FUSTERIES:** els tancaments exteriors de les façanes seran d'alumini sense trencament de pont tèrmic i lacat a color a definir per la DF. Les portes d'accés a la recepció, oficines i vestuaris seran de les mateixes característiques que les finestres per tal de donar uniformitat al conjunts. Els vidres seran laminats de seguretat amb dues llunes 6+6mm sense cambra d'aire. Aquests conjunts diposaran d'una fulla oscilobantent a la part superior, la qual podrà proporcionar ventilació natural a l'interior. La resta de portes exteriors però que donen accés a altres espais de serveis seran portes d'acer galvanitzat. Finalment, les portes interiors seran de melamina. Totes les portes diposaran de maneres i topall. I les portes exteriors de pany i clau.

**MOBILIARI:** Referent al mobiliari, es muntarà un mirall adherit sobre tauler de fusta per a cada zona de rentamans. Els rentamans estaran encastars a un taulell de resines sintètiques termoenduribles reforçada amb fibres de fusta HPL, de 16 mm de gruix i 60 cm d'amplada, amb cantells bisellats, fixat a estructura de base formada per esquadra de suport d'acer galvanitzat.

Les actuacions es veuen reflectides a la documentació gràfica.

# MEMORIA TECNICA
# DE LA ESTRUCTURA

MEMORIA TECNICA DE LA ESTRUCTURA

1.- Descripción y justificación de la solución adoptada.

2.- DB-SE.

3.- Acciones previstas en el cálculo (DB-SE-AE)

4.- Materiales y elementos estructurales.

5.- Verificaciones y combinaciones

6.- Proceso constructivo.

7.- Conservación de la estructura.

## 1.- Descripción y justificación de la solución estructural adoptada.

### 1.1- Datos previos.

La presente memoria documenta técnicamente, la estructura para la piscina, vestuarios y edificios auxiliares en Llinars del Vallès, Barcelona.

Tanto el edificio de los vestuarios como la piscina, tienen una sola planta y se disponen con una geometría irregular. Tanto para el desarrollo de la piscina como de los edificios anexos, se ejecutará una losa de cimentación. Perimetralmente se dispondrán muros de hormigón armado con alturas variables en función de las distintas profundidades de cada zona. En el perímetro de toda la instalación, se ha previsto, igualmente, muros de hormigón armado con el fin de contener las tierras en función del desnivel existente en las parcelas colindantes.

La tipología estructural adoptada para la construcción del edificio se resuelve de la siguiente manera.

### 1.2.- Sistemas estructurales.

#### - Cimentación.

La cimentación se ejecutará mediante una losa maciza de 35cm de espesor en el caso de los edificios anexos y 40cm para el caso de la piscina y la caseta de las instalaciones.

#### - Elementos verticales.

Tanto la caseta de las instalaciones, la estructura vertical se desarrolla mediante muros de hormigón . Para el caso del edificio anexo, se utilziarán muros de bloque armados de espesor 15cm, según planos de proeycto.

#### - Elementos horizontales.

La estructura horizontal se ejecuta mediante una losa maciza de 20cm de espesor.

## 2.- Seguridad estructural.

### 2.1- Normativa considerada.

Para la redacción del presente proyecto se ha previsto la utilización y el cumplimiento de los siguientes Documentos Básicos y Normas Básica Española vigentes.

| | |
|---|---|
| -DB-SE-AE. | Acciones en la edificación |
| -DB-SE-C. | Cimientos |
| -DB-SE-A. | Acero |
| -DB-SE-F. | Fábricas |
| -DB-SE-M. | Madera |
| -DB-SE-I. | Incendio |
| -NCSE-02 | Norma sismo resistente |
| -CE | Código Estructural |

### 2.2-Metodos de cálculo

Para la determinación de esfuerzos en los diferentes elementos estructurales se utilizan los postulados básicos de la elasticidad y la resistencia de materiales, aplicándolos de forma diversa y a través de diferentes metodologías, en función del elemento o elementos a analizar.

Por otra parte, para la comprobación de secciones de hormigón, se utilizan las bases de cálculo en rotura, considerando que el material trabaja en régimen anaelástico, contemplando, de esta manera, la fisuración por tracción y la elasto-pasticidad en compresión. Para la comprobación de las secciones de acero, se utilizan generalmente las bases de cálculo elástico, aunque en ocasiones, se contemplan puntualmente las consideraciones del cálculo elasto-plástico.

La especificación de las metodologías utilizadas por los análisis de los diversos tipos estructurales se detalla a continuación.

#### 2.2.1.- Soporte informático.

El modelo estructural ha sido analizado mediante soporte informático, para este estudio se ha utilizado el programa CYPE 2025 con licencia Nº 92247.

#### 2.2.2.- Estructuras de barras.

Su análisis se lleva a cabo mediante el cálculo matricial de estructuras, aplicado tanto a estructuras planas como espacial.

Para la determinación de las matrices de rigidez de cada una de las barras de la estructura se contemplan los dos teoremas de Mohr, relacionando todos los movimientos posibles de los extremos de las barras con los esfuerzos que los provocan.

En estos casos en los que la esbeltez de la estructura es determinante, se utiliza también el cálculo matricial, aunque basado en la formulación de la ecuación de equilibrio de la estructura bajo las consideraciones de la teoría de 2º orden, deduciendo, pues, las matrices de rigidez de las barras y los vectores de acciones en función del esfuerzo axial.

#### 2.2.3.- Muros pantalla y muros de contención.

Para el análisis tanto de la estabilidad de muros de contención como de muros pantalla se utiliza la teoría de empujes activos y pasivos de Rankine.

Para ello se discretiza la pantalla y se solicita, por un lado, a los empujes que corresponda y por otro a la reacción que provoca su empotramiento sobre un terreno elástico. En el caso del cálculo

de muros de contención, el soporte se resuelve directamente mediante una zapata, y en el caso del análisis de muros pantalla mediante su empotramiento en el terreno, considerando el criterio de Blum.

2.2.4.- Comprobación de perfilería metálica.

La comprobación de perfilería metálica se realiza en base a las consideraciones de la normativa DB-SE-AE "Estructuras metálicas", y del Código Estructural, según métodos elásticos y anaelásticos.

2.2.5.- Armado de secciones de hormigón armado.

El armado de secciones de hormigón se realiza en rotura, considerando el diagrama □□□ que se detalla en el apartado 3º de la presente.

Mediante esta metodología se analizan casos de flexión simple recta y esviada, flexo-compresión recta y esviada, compresión compuesta recta y esviada y tracción compuesta recta o esviada, según la determinación del plano de deformaciones y el planteamiento de las ecuaciones de equilibrio interno.

Para la comprobación a esfuerzos rasantes, tipo cortante o momento torsor, se utilizan las consideraciones de la Normativa Código Estructural.

## 2.3-Capacidad portante

Todas las verificaciones y combinaciones se han realizado en todos los casos según los coeficientes parciales expresados en el punto 5 de la presente memoria o en el DB-SE.

2.3.1.- Verificaciones y combinación de acciones.

Se ha comprobado que el efecto de las acciones, en relación a las vibraciones o deterioro, no alcanzan los valores límites establecidos en el DB-SE considera que hay suficiente estabilidad cuando se cumple la condición:

$E_{d,dst} < E_{d,stb}$ siendo:

$E_{d,dst}$: Valor de cálculo del efecto de las acciones desestabilizadoras.

$E_{d,stb}$: Valor de cálculo del efecto de las acciones estabilizadoras.

2.- Se considera que hay suficiente resistencia de la estructura, de un elemento o de una unión cuando se cumple la condición

$E_d < R_d$ siendo:

$E_d$: Valor de cálculo del efecto de las acciones.

$R_d$: Valor de cálculo de las resistencias correspondientes.

2.3.2.- Combinaciones.

Las combinaciones, para situación persistente o transitoria, se han determinado mediante la expresión:

$$\sum_{j\geq 1} \gamma_{G,j} G_{k,j} + \sum_{j\geq 1} \gamma_{G^*,j} G^*_{k,j} + \gamma_P P_k + \gamma_{Q,1} Q_{k,1} + \sum_{i>1} \gamma_{Q,i} \psi_{0,i} Q_{k,i}$$

es decir, considerando la actuación simultánea de:

a) todas las acciones permanentes, en valor de cálculo (γG · Gk), incluido el pretensado (γP · P)
b) Una acción variable cualquiera, en valor de cálculo ( γQ · Qk ), debiendo adoptarse como tal una tras otra sucesivamente en distintos análisis
c) El resto de las acciones variables, en valor de cálculo de combinación ( γQ · ψ0 · Qk ).

Para las acciones correspondientes a una situación extraordinaria, se ha determinado mediante la expresión:

$$\sum_{j\geq 1}\gamma_{G,j}\,G_{k,j}+\sum_{j\geq 1}\gamma_{G^*,j}\,G^*_{k,j}+\gamma_P P_k+\gamma_A A_k+\gamma_{Q,1}\psi_{1,1}Q_{k,1}+\sum_{i>1}\gamma_{Q,i}\psi_{2,i}Q_{k,i}$$

es decir, considerando la actuación simultánea de:

a) todas las acciones permanentes, en valor de cálculo (γG · Gk), incluido el pretensado (γP · P)

b) Una acción accidental en valor de cálculo (Ad), debiendo analizarse sucesivamente con cada una de ellas.

c) El resto de las acciones variables, en valor de cálculo frecuente ( γQ · ψ1 · Qk ), debiendo adoptarse como tal, una tras otra sucesivamente en distintos análisis con cada acción accidental considerada.

d) El resto de las acciones variables, en calor de cálculo casi permanente ( γQ · ψ2 · Qk )

En situación extraordinaria, todos los coeficientes de seguridad ( γG, γP, γQ ), son iguales a cero si su efecto es favorable, o la unidad si es desfavorable, en los términos anteriores.

En los casos en los que la acción accidental sea la acción sísmica, todas las acciones variables concomitantes se tendrán en cuenta con su valor casi permanente, según la expresión:

$$\sum_{j\geq 1}\gamma_{G,j}\,G_{k,j}+\sum_{j\geq 1}\gamma_{G^*,j}\,G^*_{k,j}+\gamma_P P_k+\gamma_A A_k+\gamma_{Q,1}\psi_{1,1}Q_{k,1}+\sum_{i>1}\gamma_{Q,i}\psi_{2,i}Q_{k,i}$$

## 2.4-Aptitud al servicio

### 2.4.1. Flechas

Los criterios utilizados para el dimensionado de todos y cada uno de los elementos que configuran la estructura del edificio se han basado en observar el cumplimiento de dos requisitos básicos, a saber, el que se refiere a los estados límites, por un lado, y el de satisfacer la aptitud al servicio, por el otro.

Respecto al cumplimiento del primer requisito hay que señalar que en ningún caso se sobrepasan las tensiones admisibles de los materiales, contemplando, para hacer esta afirmación, los fenómenos de inestabilidad global y local de los elementos.

Respecto al cumplimento del segundo, se ha incidido sistemáticamente en el control de las deformaciones de todos los elementos resistentes, observándose los límites que a continuación se detallan:

| Elemento | Flecha activa relativa |
|---|---|
| Jácena de apeo de muros de carga de obra de fábrica de ladrillo. | 1/1000 |
| Jácenas de apeo de estructuras de pilares y jácenas. | 1/750 |
| Forjados con tabiques. | 1/500 |
| Forjados sin tabiques. | 1/400 |
| Resto de casos. | 1/300 |
| Cualquier combinación de acciones características | 1/350 |
| Cualquier combinación de acciones casi permanentes | 1/300 |

### 2.4.2. Desplazamientos horizontales

En los elementos verticales se han contemplado un desplome máximo total y local, cumpliéndose los siguientes límites:

| | |
|---|---|
| Desplome total | 1/500 de la H total del Edif. |
| Desplome local | 1/250 de la h de la planta. |

| | |
|---|---|
| Cualquier combinación de acciones casi permanentes | Desplome relativo 1/250 |

2.4.3. Vibraciones

Se ha comprobado que la frecuencia propia de la estructura se aleja suficientemente de las frecuencias previstas para la utilización del edificio, siendo las siguientes en función de su uso:

- Gimnasios y polideportivos: 8Hz
- Salas de fiesta y locales de pública concurrencia sin asientos fijos: 7Hz
- Locales de espectáculos con asientos fijos: 3'4Hz

2.4.4. Combinaciones de aptitud de servicio

Se han determinado las siguientes combinaciones para el cálculo en cuanto a la aptitud al servicio según las acciones sean de corta o larga duración y en función de los efectos que estas causen:

-Los efectos debidos a las acciones de corta duración que pueden resultar irreversibles, se determinan mediante combinaciones de acciones, del tipo denominado característica, a partir de la expresión

$$\sum_{j\geq 1}\gamma_{G,j}G_{k,j} + \sum_{j\geq 1}\gamma_{G^*,j}G^*_{k,j} + \gamma_P P_k + \gamma_{Q,1}Q_{k,1} + \sum_{i>1}\gamma_{Q,i}\psi_{0,i}Q_{k,i}$$

Es decir, considerando la actuación simultánea de:

- todas las acciones permanentes, en valor característico (Gk);
- una acción variable cualquiera, en valor característico (Qk), debiendo adoptarse como tal una tras otra sucesivamente en distintis análisis;

el resto de acciones variables, en valor de la combinación (□o Qk).

-Los efectos debidos a las acciones de corta duración que pueden resultar reversibles, se determinan mediante combinaciones de acciones, del tipo denominado frecuente, a partir de la expresión

$$\sum_{j\geq 1}\gamma_{G,j}G_{k,j} + \sum_{j\geq 1}\gamma_{G^*,j}G^*_{k,j} + \gamma_P P_k + \gamma_{Q,1}\psi_{1,1}Q_{k,1} + \sum_{i>1}\gamma_{Q,i}\psi_{2,i}Q_{k,i}$$

Es decir, considerando la actuación simultánea de:

- todas las acciones permanentes, en valor característico (Gk);
- una acción variable cualquiera, en valor característico (Qk), debiendo adoptarse como tal una tras otra sucesivamente en distintis análisis;

el resto de acciones variables, en valor de la combinación (□o Qk).

-Los efectos debidos a las acciones de larga duración, se determinan mediante combinaciones de acciones, del tipo denominado casi permanente, a partir de la expresión

$$\sum_{j\geq 1}\gamma_{G,j}G_{k,j} + \sum_{j\geq 1}\gamma_{G^*,j}G^*_{k,j} + \gamma_P P_k + \sum_{i>1}\gamma_{Q,i}\psi_{2,i}Q_{k,i}$$

siendo:
a) todas las acciones permanentes, en valor característico (Gk);
b) todas las acciones variables, en valor casi permanente ((□2 Qk).

## 3- Acciones previstas en el cálculo.

En la evaluación de las acciones para determinar el comportamiento estructural del edificio que se presenta, se ha tenido en cuenta la normativa DB-SE-AE, "Acciones en la edificación", así como la normativa NCSR-02, "Norma Sismorresistente".

En base a ellas se han evaluado las acciones gravitatorias, las sobrecargas de uso, de nieve, y las acciones derivadas del viento, del sismo, de la temperatura y de la inestabilidad de los materiales (acciones reológicas). Cada una de ellas se detallan a continuación.

### 3.1- Acciones gravitatorias.

Estas son las producidas por el peso de los elementos constructivos (permanentes), de los objetos que puedan actuar por razón de uso y de la nieve (variables).

#### 3.1.1. Acciones permanentes

Las primeras, se entienden diferenciadas en:

a) Peso propio: carga debida al peso de los elementos resistentes.

b) Cargas permanentes: cargas debidas al peso de todos los elementos constructivos e instalaciones fijas que soporta al elemento.

#### 3.1.2. Acciones variables

Las segundas están compuestas por tres tipologías diferentes de acciones, que obedecen siempre al peso de todos los objetos que puedan gravitar sobre un elemento: personas, muebles, instalaciones amovibles, materias almacenables, vehículos, etc. Estas tres tipologías son las siguientes:

- Sobrecargas superficiales: son acciones derivadas del uso, actúan superficialmente sobre los elementos resistentes. En ellas se incluyen las de uso propiamente dichas, según la tabla 3.1. de la norma DB-SE-AE, las de tabiquería, de acuerdo con las consideraciones del articulo 2.1. de la misma norma y todas aquellas que, a juicio del proyectista, se valore en cada caso más adecuado, donde el uso concreto de la zona sometida a carga.
- Cargas concentradas: Es una carga aplicada sobre el pavimento acabado en una superficie cuadrada de 20cm en zonas de tráfico y aparcamiento y de 5cm de lado en el resto, que se ha contemplado simultáneamente con las sobrecargas uniformemente distribuidas, en cualquier punto de la zona analizada. Se ajusta igualmente a la tabla 3.1 del DB-SE-AE.
- Sobrecargas lineales: son las acciones derivadas del uso, que actúan a lo largo de una línea. Al respecto, se tiene en consideración las sobrecargas de los balcones volados, a los que hace referencia el artículo 3.1.1 de la normativa y se aplica según el artículo 3.2 de la misma norma.

La determinación final de las intensidades de las acciones de cada una de las tipologías detalladas, se consigue a partir de considerar los puntos 7 y 8 del artículo 3.1.1 del DB-SE-AE, referente a las combinaciones y alternancias de cargas de sobrecargas.

Las que tienen en cuenta la acción producida sobre los elementos resistentes por acumulación de la nieve, se estima en orden a la aplicación del artículo 3.5 de la norma DB-SE-AE, referente al peso específico de la nieve, las sobrecargas a considerar sobre elementos horizontales, sobre los planos inclinados, las acciones debidas a la acumulación de la nieve y a las alternancias de carga fruto de dicha acumulación, respectivamente.

Con relación a las consideraciones y definiciones establecidas, las acciones consideradas en el cálculo de la estructura del edificio que se presenta son las siguientes:

3.1.3.- Pesos propios y cargas permanentes:

Para la determinación de los pesos propios y las cargas permanentes debidas a los materiales y sistemas constructivos empleados, se han tomado como referencia los que figuran en anejo C de la norma referida, de los que destacan:

De la siguiente tabla, complétese con los materiales que sean necesarios en cada caso.

| | | |
|---|---|---|
| a) Muros de fábrica de ladrillo: | - de ladrillo macizo: | 18 kN/$m^3$. |
| | - de ladrillo perforado: | 15 kN/$m^3$. |
| | - de ladrillo hueco: | 12 kN/$m^3$. |
| b) Muros de fábrica de bloque: | - de bloque hueco de mortero: | 16 kN/$m^3$. |
| | - de bloque hueco de yeso: | 12 kN/$m^3$. |
| c) Hormigón Armado: | - Hormigón armado: | 25 kN/$m^3$ |
| | - Hormigón en masa: | 23 kN/$m^3$. |
| | - Hormigón de escoria: | 16 kN/$m^3$. |
| d) Pavimentos: | - Hidráulico o cerámico: | 1 kN/$m^2$. |
| | - Terrazo: | 0.8 kN/$m^2$. |
| | - Parquet: | 0.4 kN/$m^2$. |
| e) Materiales de cubierta: | - Plancha metálica: | 0.15 kN/$m^2$. |
| | - Teja curva: | 0.60 kN/$m^2$. |
| | - Pizarra: | 0.30 kN/$m^2$. |
| | - Tablero cerámico: | 0.5 kN/$m^2$. |

3.1.4.- Cargas lineales consideradas.

Las intensidades consideradas de las acciones gravitatorias lineales se detallan en la siguiente relación:

De la siguiente relación, complétese con los materiales que se hayan colocado en cada caso.

- Cerramientos cerámicos sin perforaciones, de altura hasta 3.00 metros. 10 kN/m
- Cerramientos cerámicos perforados, de altura hasta 3.00 metros. 7 kN/m
- Cerramientos ligeros, de altura hasta los 3.00 metros. 4 kN/m
- Tabiques, de altura hasta 3.00 m y espesor 10 cms. 3 kN/m
- Tabique de espesor 15 cms., de ladrillo perforado, de altura hasta 3.00 metros 7 kN/m

3.1.5.- Cargas superficiales consideradas.

2-Zona: CUBIERTA EDIFICIO VESTUARIOS Y ANEXOS

Tipo de forjado ..... losamaciza
Canto ..... 20cm

Peso propio ..... 500 KG
Sobrecarga de uso ..... 200 kg
Cargas permanentes ..... 200 kg

TOTAL ..... 900 kg

### 3.2.- Acciones del viento.

Son las producidas por el viento sobre los elementos resistentes. Para su determinación se considera que este actúa horizontalmente sobre los elementos resistentes.

La intensidad de su acción se evalúa directamente a partir de la velocidad básica con la que puede desplazarse y chocar contra un elemento resistente, según el anejo D, o la presión dinámica $q_b$.

La acción concreta sobre un elemento superficial se deduce aplicando los artículos 3.3.2 3.3.3 3.3.4 y 3.3.5 de la anterior normativa, relativos a la determinación del coeficiente eólico, del tipo de edificio y el coeficiente de exposición en función del grado de aspereza.

En el caso particular que se discute, los parámetros considerados son los que se detallan:

- Situación topográfica (según artículo D.1): B
- Altura de coronación del edificio: 6,85 m
- Grado de aspereza: III
- Presión dinámica W: 0.5 kN/m2
- Coeficiente de exposición: Ce: 1,6
- Coeficientes eólicos: -Coeficiente Cp,x: 0,7
  -Coeficiente Cs,x: -0,3
  -Coeficiente Cp,y: 0,7
  -Coeficiente Cs,y: -0,4

### 3.3.- Acciones térmicas y reológicas.

No se ha previsto junta de dilatación ya que el edificio no supera los 40 m. No previéndose por tanto cargas térmicas ni reológicas.

### 3.4.- Acciones Accidentales.

3.4.1.- Acción sísmica.

Norma considerada: "NCSR-02"

Clasificación de la construcción: De normal importancia

Aceleración sísmica: < 0.04 g

A la vista de estos datos, no se ha contemplado en el cálculo los esfuerzos debidos a las acciones sísmicas

4.2.- Acciones debidas al incendio.

Las acciones debidas el incendio son las definidas en el DB-SI, contemplando además para el tránsito de vehículos una carga superficial de 20 $Kn/m^2$ en una superficie de 3m de ancho por 8m de largo en cualquier posición de una banda de 5m de ancho y en las zonas de maniobra. Se ha contemplado además una carga de 45 kN en una superficie cuadrada de 20cm de lado.

3.4.3.- Acciones de impacto

Se ha contemplado una fuerza de impacto actuando en sentido horizontal paralelo a la vía de 50kN y en sentido perpendicular de 25 kN, no simultáneas. Aplicadas a 60vm del plano de rodadura y sobre una superficie de 0.25 m de altura y 1,5 m de anchura.

### 3.5.- Acciones debidas al terreno.

Se han contemplado las acciones debidas al terreno conforme al DB-SE y al DB-SE-AE, en cuanto a pesos, ángulos de rozamiento y naturaleza de las cargas se refiere.

Por tanto, se han calculado los empujes debidos al peso propio del terreno, a las presiones transmitidas por el uso de las zonas colindantes, las edificaciones próximas, así como el empuje generado por el agua freática, según los datos reflejados en el punto 4.2 de la presente memoria.

### 3.6.- Coeficientes parciales de seguridad de las acciones.

Para las comprobaciones de los Estados Limite de Servicio se adoptan los valores de la tabla siguiente:

| TIPO DE ACCIÓN | | Efecto favorable | Efecto desfavorable |
|---|---|---|---|
| Permanente | | $\gamma_G$ = 1,00 | $\gamma_G$ = 1,00 |
| Pretensado | Armadura pretesa | $\gamma_P$ = 0,95 | $\gamma_P$ = 1,05 |
| | Armadura postesa | $\gamma_P$ = 0,90 | $\gamma_P$ = 1,10 |
| Permanente de valor no constante | | $\gamma_{G^*}$ = 1,00 | $\gamma_{G^*}$ = 1,00 |
| Variable | | $\gamma_Q$ = 0,00 | $\gamma_Q$ = 1,00 |

## 4.- Materiales y elementos estructurales.

Los materiales empleados para la realización de los elementos estructurales del edificio que se detallan son los siguientes:

### 4.1.- Cimentaciones.

4.1.1.- Criterios de dimensionado.

El dimensionado de las secciones de los elementos de cimentación y/o elementos de contención se realiza según la teoría de los estados límite, en cuento a capacidad portante (resistencia y estabilidad) y aptitud al servicio se refiere.

Para el dimensionado de la cimentación se han considerado las acciones reflejadas en el capítulo 3 de la presente memoria, así como las previstas en el DB-SE-AE, manteniendo la clasificación según la situación sea persistente, transitoria o extraordinaria.

Las verificaciones realizadas se han basado en el uso de un modelo adecuado para el sistema de cimentación elegido y el terreno de apoyo de la misma, no superando en ningún caso los estados límite, según el DB-SE-C. Se ha utilizado, por tanto, los coeficientes parciales para el cálculo y la comprobación de la capacidad estructual de todos los elementos de cimentación.

4.1.2.- Asientos máximos admisibles.

Los valores máximos utilizados para el cálculo han sido los siguientes:

**Tabla 2.2. Valores límite basados en la distorsión angular**

| Tipo de estructura | Limite |
|---|---|
| Estructuras isostáticas y muros de contención | 1/300 |
| Estructuras reticuladas con tabiquería de separación | 1/500 |
| Estructuras de paneles prefabricados | 1/700 |
| Muros de carga sin armar con flexión cóncava hacia arriba | 1/1000 |
| Muros de carga sin armar con flexión cóncava hacia abajo | 1/2000 |

**Tabla 2.3. Valores límite basados en la distorsión horizontal**

| Tipo de estructura | Limite |
|---|---|
| Muros de carga | 1/2000 |

En los capítulos relativos a los diferentes tipos de cimentación se encuentran otros criterios de verificación de la aptitud al servicio de éstas relacionados más específicamente con los materiales y procedimientos de construcción empleados.

Para las vibraciones previstas de corta duración se comprobará que los valores máximos de los componentes del vector velocidad del terreno y cimentación quedan por debajo de los valores establecidos en las tablas 2.4 y 2.5.

4.1.3.- Estudio geotécnico.

Se dispone de estudio geotécnico suministrado por la empresa LOSOM. Para el cálculo de cimentación se ha utilizado los parámetros en él reflejado, siendo la tensión admisible de 2Kg/cm$^2$ con un coeficiente de balasto observado de 5Kg/cm$^3$.

4.1.4.- Tipología de cimentación.

La tipología empleada para el caso que nos ocupa será de losas de cimentación según los planos de proyecto, habiendo sido calculadas mediante el modelo de bielas comprimidas y tirantes

traccionados y cumpliendo las cuantías mínimas indicadas en la tabla 42.3.5 de la instrucción de hormigón estructural. Se ejecutará sobre un lecho de hormigón de limpieza con un espesor de 10 cm.

## 4.2.- Hormigón.

Se utiliza tanto para la realización de elementos resueltos con hormigón en masa como armado, y sus características más relevantes y, a la vez, consideradas para la realización de los cálculos que se adjuntan, son los siguientes.

4.2.1.- Resistencia a compresión.

La resistencia a compresión coincide con la resistencia característica, definida en la Instrucción CE en el artículo 43, su valor, que se detalla particularmente en los planos de proyecto, es fck hormigón 25 $N/mm^2$.

Hay que destacar que sea cual sea el valor de la resistencia, ésta deberá alcanzarse al 28º día de su puesta en obra, de manera que al 7º ya se haya obtenido, al menos, el 75% de la resistencia que se solicita.

4.2.2.- Docilidad.

La docilidad que le corresponderá a todo el hormigón colocado en obras es la fluida, según la definición al respecto en el artículo 33.5, del Código Estructural, y que la puesta en obra de los hormigones con otras docilidades está estrictamente prohibida, excepto en aquellos casos en los que se utilicen fluidificantes o superplastificantes.

4.2.3.- Tamaño máximo del árido.

El tamaño máximo del árido aceptado para la confección de los hormigones de la obra deberá cumplir los requerimientos del artículo 30, del Código Estructural, no aceptándose valores del mismo superiores a los 40 mm en cimentación ni a 20 mm en el resto de la estructura.

4.2.4.- Aspecto externo.

No se aceptará hormigones fisurados, no homogéneos en color o textura o sucios, tanto de fluorescencias como de manchas de óxido o grasa.

4.2.5.- Características mecánicas. Diagrama □□□ de cálculo.

Para la determinación del comportamiento de las piezas de hormigón armado y para su comprobación ulterior se han adoptado el diagrama parábola-rectángulo, preconizado por el Código Estructural en su artículo 33.

4.2.6.-Características mecánicas. Módulo de deformación longitudinal.

Para la determinación de los estados de corrimientos de la estructura, se han considerado los módulos de elasticidad longitudinal que se detalla.

a) Cargas instantáneas o rápidamente variables. $E_j$ = 10.000 $N/mm^2$

b) Módulo instantáneo de deformación longitudinal secante: $E_j$ = 8.500 $N/mm^2$

$E_j$ es el módulo de elasticidad inicial del hormigón, a la edad de j días.

$f_{cm,j}$ es la resistencia media a compresión del hormigón, a la edad de j días.

4.2.7.- Características mecánicas. Retracción.

La retracción se compatibiliza en aquellos casos en los que es presumible una alteración del comportamiento de determinados elementos, causada por el fenómeno que se discute.

Los valores tenidos en cuenta en estos casos son consecuencia de someter al hormigón a deformaciones unitarias de 2.5 $10^{-4}$.

Dados las similitudes de la retracción con los efectos producidos por la dilatación térmica, los criterios de aplicación de las acciones resultantes son idénticos a los tenidos en cuenta en las acciones térmicas.

4.2.8.- Características mecánicas. Fluencia.

La fluencia del material se tiene en cuenta afectando al módulo de elasticidad por un coeficiente constante menor que 0,45 $f_{cm,i}$ según criterios establecidos en el artículo 3.1.4 del anejo 19, del Código Estructural.
No obstante, si la situación lo requiere, la fluencia se incorpora al cálculo mediante procesos mucho más complejos, de acuerdo con los criterios que se esbozan en ese mismo artículo.

4.2.9.- Coeficiente de Poisson.
Se observa un valor de 0.2.

4.2.10.- Coeficiente de Dilatación Térmica.
Se tiene en cuenta un valor igual a $10^{-5}$

## 4.3.- Acero corrugado.

Se utiliza principalmente por la confección del hormigón armado, aunque en determinadas ocasiones también se requiere su uso en elementos especiales (anclajes, tirantes, etc.), cosa que figura explícitamente en los planos de proyecto. Sus características más relevantes son las que se detallan a continuación:

4.3.1.- Límite elástico del acero.
El límite elástico del acero utilizado para la confección de las armaduras del hormigón se fija en fyk acero 5100 kg/cm$^2$., su definición y concreción se adecua a los criterios que fija el artículo 34, del Código Estructural.

4.3.2.- Diagrama □□□ de cálculo.
Los diagramas tensión-deformación de las barras de armado obedecen a los que se reflejan en el artículo 3 del anejo 19 del Código Estructural, correspondientes a los aceros del armado pasivo. Para los primeros, se tiene en cuenta una diagrama bilineal, su tramo inclinado observa una pendiente de E=2.100.000 Kg/ cm$^2$, válido para umbrales de tensión comprendidos entre

$$-f_{yd} < s < f_{yd}$$

siendo $f_{yd}$ la resistencia de cálculo del material, obtenida después de aplicar en el límite elástico y el coeficiente de minoración de resistencia.
Para los aceros del armado activo, el diagrama observa un primer tramo elástico con la misma pendiente de los aceros del armado pasivo, y un segundo tramo no lineal de ecuación expresada en el artículo 3.3 del anejo 19 del Código Estructural.

4.3.3.- Características del material y ensayos.
Las características de los materiales que se detallan, así como los ensayos a que deberán realizarse, quedan determinados en los planos de proyecto.

## 4.4.- Durabilidad del hormigón armado.

La durabilidad de una estructura de hormigón es la capacidad para soportar, durante la vida útil para la que ha sido proyectada, las condiciones físicas y químicas a las que está expuesta, y que podrían llegar a provocar su degradación como consecuencia de efectos diferentes y solicitaciones consideradas en el análisis estructural. A tal efecto complirá con lo estipulado en el Capítulo 9 del Código Estructural).

4.4.1.- Recubrimientos.

Se considerarán los siguientes recubrimientos mínimos en función del los diferentes ambientes:

| Clase de exposición | Tipo de cemento | Resistencia característica del hormigón [N/mm$^2$] | Vida útil de proyecto ($t_g$), (años) | |
|---|---|---|---|---|
| | | | 50 | 100 |
| I | Cualquiera | $f_{ck} \geq 25$ | 15 | 25 |
| II a | CEM I | $25 \leq f_{ck} < 40$ | 15 | 25 |
| | | $f_{ck} \geq 40$ | 10 | 20 |

4.4.1.- Separadores.

Los recubrimientos se garantizarán mediante el empleo de calzos o separadores colocados en obra. Estos deberán estar constituidos por materiales resistentes a la alcalinidad del hormigón, hormigón, mortero, plástico rígido o material similar, y no inducir a la corrosión de las armaduras. Deben ser al menos tan impermeables al agua como el hormigón, y ser resistentes a los ataques químicos a que se puede ver sometido éste.

La disposición de los separadores será la siguiente:

| Elemento | | Distancia máxima |
|---|---|---|
| Elementos superficiales horizontales (losas, forjados, zapatas y losas de cimentación, etc.) | Emparrillado inferior | 50 ø ≤ 100 cm |
| | Emparrillado superior | 50 ø ≤ 50 cm |
| Muros | Cada emparrillado | 50 ø ó 50 cm |
| | Separación entre emparrillados | 100 cm |
| Vigas [1)] | | 100 cm |
| Soportes [1)] | | 100 ø ≤ 200 cm |
| [1)] Se dispondrán, al menos, tres planos de separadores por vano, en el caso de las vigas, y por tramo, en el caso de los soportes, acoplados a los cercos o estribos.<br>ø Diámetro de la armadura a la que se acople el separador. | | |

## 4.5.- Acero laminado.

Se utiliza para la confección de elementos estructurales metálicos, tanto principales como secundarios. Sus características más relevantes son las que se detallan:

### 4.5.1.- Resistencia de cálculo del acero.

El límite elástico considerado para el cálculo de los elementos de estructura metálicos son los que establece la Norma DB-SE-AE "Estructuras metálicas", en el capítulo 4º, artículo 4.2, y la EAE en el capítulo VI, artículo 27, esto es:

- S275JR: 275 N/mm$^2$
- S355JR: 355 N/mm$^2$

La resistencia de cálculo queda también fijada en este mismo artículo alcanzando valores coincidentes con los del límite elástico antes mencionados.

### 4.5.2.- Tipo de acero.

El acero utilizado en los elementos estructurales que constituyen el proyecto que se adjunta es S275JR o S355JR.

### 4.5.3.- Constantes elásticas del acero.

Las constantes elásticas tenidas en consideración para el cálculo y comprobación de las secciones de acero laminado son las siguientes:

- Módulo de elasticidad (E) 210.000 N/mm$^2$
- Módulo de elasticidad transversal (G) 81.000 N/mm$^2$
- Coeficiente de Poisson 0.3

### 4.5.4.- Coeficiente de dilatación térmica.

Se ha tenido en cuenta el valor 1.2 $10^{-5}$ (ºC) $^{-1}$

### 4.5.5.- Densidad.

El valor contemplado ha sido □□7850 kg/cm$^3$

## 4.6.- Obras de fábrica.

Cuando se detalle en los planos adjuntos, determinados elementos o la totalidad de los mismos se resolverán mediante obra de fábrica de ladrillo. Las características más relevantes del material se detallan a continuación:

4.6.1.- Resistencia del ladrillo.

Los valores mínimos de resistencia de los ladrillos utilizados, se han adecuado a la siguiente relación:

- ladrillos macizos 20 N/mm$^2$
- ladrillos perforados 20 N/mm$^2$

Esta resistencia se entenderá como la definida en el artículo 4.6.2 de la Norma DB-SE-F.

4.6.2.- Resistencia de los morteros.

Los morteros utilizados serán del tipo M-10 que les corresponde una resistencia de 10 N/mm$^2$, su dosificación en volumen se designa por la proporción, en volumen, de los componentes fundamentales, cemento, cal y arena (1:1:5).

4.6.3.- Resistencia característica de la obra de fábrica.

La resistencia característica se determinará en función de lo que establece el artículo 4.6.2. de la DB-SE-F

La resistencia de cálculo obtenida de la característica, después de aplicar un coeficiente reductor de resistencia, no será en ningún caso inferior a los que se detallan:

- ladrillos macizos 8 N/mm$^2$
- ladrillos perforados 7 N/mm$^2$
- ladrillos huecos No se admiten como fábrica estructural

4.6.4.- Deformabilidad de la fábrica de ladrillo.

El módulo de elasticidad secante instantáneo (E) tenido en cuenta para el cálculo de los elementos de obra de fábrica ha sido:

- ladrillos macizos 8000 N/mm$^2$
- ladrillos perforados 7000 N/mm$^2$

Módulo de elasticidad transversal G=40%E

4.6.5.- Resistencia a flexión

Se han contemplado los siguientes valores en función del tipo de piezas (solo morteros ordinarios fm ≥ 5 N/mm$^2$)

| Tipo de pieza | Morteros ordinarios | | | |
|---|---|---|---|---|
| | $f_m$<5 N/mm$^2$ | | $f_m \geq$ 5N/mm$^2$ | |
| | $f_{xk1}$ | $f_{xk2}$ | $f_{xk1}$ | $f_{xk2}$ |
| Cerámica | 0,10 | 0,20 | 0,10 | 0,40 |
| Silico-calcáreos | 0,05 | 0,20 | 0,10 | 0,40 |
| Hormigón ordinario | 0,05 | 0,20 | 0,10 | 0,40 |
| Hormigón celular de autoclave | 0,05 | 0,40 | 0,10 | 0,40 |
| Piedra artificial | 0,05 | 0,40 | 0,10 | 0,40 |
| Piedra natural | 0,05 | 0,20 | 0,10 | 0,40 |

## 5.- Coeficientes de seguridad.

Los coeficientes de seguridad adoptados afectan tanto a las características mecánicas de los materiales utilizados, como a las acciones que solicitarán a la estructura. Ambos se detallan a continuación:

### 5.1.- Coeficientes de minoración de resistencias.

Los coeficientes de minoración de resistencias graban de manera diferente a los elementos, en función de diversos parámetros, de los cuales el más relevante es el tipo de material que los constituyen. Para cada caso se tiene:

5.1.2.- Cimentaciones

| Situación de dimensionado | Tipo | Materiales | | Acciones | |
|---|---|---|---|---|---|
| | | $\gamma_R$ | $\gamma_M$ | $\gamma_E$ | $\gamma_F$ |
| Persistente o transitoria | Hundimiento | 3,0[1] | 1,0 | 1,0 | 1,0 |
| | Deslizamiento | 1,5[2] | 1,0 | 1,0 | 1,0 |
| | Vuelco[2] | | | | |
| | Acciones estabilizadoras | 1,0 | 1,0 | 0,9[3] | 1,0 |
| | Acciones desestabilizadoras | 1,0 | 1,0 | 1,8 | 1,0 |
| | Estabilidad global | 1,0 | 1,8 | 1,0 | 1,0 |
| | Capacidad estructural | -[4] | -[4] | 1,6[5] | 1,0 |
| | Pilotes | | | | |
| | Arrancamiento | 3,5 | 1,0 | 1,0 | 1,0 |
| | Rotura horizontal | 3,5 | 1,0 | 1,0 | 1,0 |
| | Pantallas | | | | |
| | Estabilidad fondo excavación | 1,0 | 2,5[6] | 1,0 | 1,0 |
| | Sifonamiento | 1,0 | 2,0 | 1,0 | 1,0 |
| | Rotación o traslación | | | | |
| | Equilibrio límite | 1 | 1,0 | 0,6[7] | 1,0 |
| | Modelo de Winkler | 1 | 1,0 | 0,6[7] | 1,0 |
| | Elementos finitos | 1,0 | 1,5 | 1,0 | 1,0 |
| Extraordinaria | Hundimiento | 2,0[8] | 1,0 | 1,0 | 1,0 |
| | Deslizamiento | 1,1[2] | 1,0 | 1,0 | 1,0 |
| | Vuelco[2] | | | | |
| | Acciones estabilizadoras | 1,0 | 1,0 | 0,9 | 1,0 |
| | Acciones desestabilizadoras | 1,0 | 1,0 | 1,2 | 1,0 |
| | Estabilidad global | 1,0 | 1,2 | 1,0 | 1,0 |
| | Capacidad estructural | -[4] | -[4] | 1,0 | 1,0 |
| | Pilotes | | | | |
| | Arrancamiento | 2,3 | 1,0 | 1,0 | 1,0 |
| | Rotura horizontal | 2,3 | 1,0 | 1,0 | 1,0 |
| | Pantallas | | | | |
| | Rotación o traslación | | | | |
| | Equilibrio límite | 1,0 | 1,0 | 0,8 | 1,0 |
| | Modelo de Winkler | 1,0 | 1,0 | 0,8 | 1,0 |
| | Elementos finitos | 1,0 | 1,2 | 1,0 | 1,0 |

[1] En pilotes se refiere a métodos basados en ensayos de campo o fórmulas analíticas (largo plazo), para métodos basados en fórmulas analíticas (corto plazo), métodos basados en pruebas de carga hasta rotura y métodos basados en pruebas dinámicas de hinca con control electrónico de la hinca y contraste con pruebas de carga, se podrá tomar 2,0.

[2] De aplicación en cimentaciones directas y muros.

[3] En cimentaciones directas, salvo justificación en contrario, no se considerará el empuje pasivo.

(4) Los correspondientes de los Documentos Básicos relativos a la seguridad estructural de los diferentes materiales o la instrucción EHE.

(5) Aplicable a elementos de hormigón estructural cuyo nivel de ejecución es intenso o normal, según la Instrucción EHE. En los casos en los que el nivel de control de ejecución sea reducido, el coeficiente $\gamma_E$ debe tomarse, para situaciones persistentes o transitorias, igual a 1,8.

(6) El coeficiente $\gamma_M$ será igual a 2,0 si no existen edificios o servicios sensibles a los movimientos en las proximidades de la pantalla.

(7) Afecta al empuje pasivo

(8) En pilotes, se refiere a métodos basados en ensayos de campo o fórmulas analíticas; para métodos basados en pruebas de carga hasta rotura y métodos basados en pruebas dinámicas de hinca con control electrónico de la hinca y contraste con pruebas de carga, se podrá tomar 1,5

5.1.2.- Hormigón Armado.

Para la determinación de los coeficientes de minoración de resistencia hace falta distinguir entre los que se aplican directamente sobre el hormigón y los que lo hacen sobre el acero de armar. Dado que el nivel de control de los elementos de estructura de hormigón armado es control estadístico, el coeficiente a aplicar sobre el hormigón es coef. min. horm. 1.5. De la misma manera, el coeficiente a aplicar sobre el acero es coef. min. acero 1.15.

5.13.- Acero laminado.

Para los coeficientes parciales para la resistencia se adoptarán, normalmente, los siguientes valores:

a) $\gamma_{M0} = 1,05$ coeficiente parcial de seguridad relativo a la plastificación del material

b) $\gamma_{M1} = 1,05$ coeficiente parcial de seguridad relativo a los fenómenos de inestabilidad

c) $\gamma_{M2} = 1,25$ coeficiente parcial de seguridad relativo a la resistencia última del material o sección, y a la resistencia de los medios de unión

d) $\gamma_{M3} = 1,1$ coeficiente parcial para la resistencia al deslizamiento de uniones con tornillos pretensazos en Estado Límite de Servicio.

$\gamma_{M3} = 1,25$ coeficiente parcial para la resistencia al deslizamiento de uniones con tornillos pretensazos en Estado Límite de Último.

$\gamma_{M3} = 1,4$ coeficiente parcial para la resistencia al deslizamiento de uniones con tornillos pretensazos y agujeros rasgados o con sobremedida.

Los coeficientes parciales para la resistencia frente a la fatiga están definidos en el Anejo C.

5.1.4.- Obra de fábrica de ladrillo.

El coeficiente de minoración de resistencias tenido en cuenta en la determinación del comportamiento es:

| **Situaciones persistentes y transitorias** (1) | | | **Categoría de la ejecución** | | |
|---|---|---|---|---|---|
| | | | **A** | **B** | **C** |
| Resistencia de la fábrica | Categoría del control de fabricación (2) | I | 1,7 | 2,2 | 2,7 |
| | | II | 2,0 | 2,5 | 3,0 |
| Resistencia de llaves y amarres | | | 2,5 | 2,5 | 2,5 |
| Anclaje del acero de armar. | | | 1,7 | 2,2 | |
| Acero (armadura activa y armadura pasiva) | | | 1,15 | 1,15 | |

(1) Para las comprobaciones en situación extraordinaria, los coeficientes de llaves y amarres son los mismos; de las fábricas los coeficientes son 1,2 1,5 y 1,8 respectivamente para las categorías A B y C.

(2) Categorías según 8.1.1

## 5.2.- Coeficientes de mayoración de acciones.

Paralelamente a los anteriores, los de mayoración de acciones dependen del material. Con este criterio se observan los coeficientes que a continuación se detallan para todos los tipos de estructura:

| TIPO DE ACCIÓN | Situación persistente o transitoria | | Situación accidental | |
|---|---|---|---|---|
| | Efecto favorable | Efecto desfavorable | Efecto favorable | Efecto desfavorable |
| Permanente | $\gamma_G$ = 1,00 | $\gamma_G$ = 1,35 | $\gamma_G$ = 1,00 | $\gamma_G$ = 1,00 |
| Pretensado | $\gamma_P$ = 1,00 | $\gamma_P$ = 1,00 | $\gamma_P$ = 1,00 | $\gamma_P$ = 1,00 |
| Permanente de valor no constante | $\gamma_{G^*}$ = 1,00 | $\gamma_{G^*}$ = 1,50 | $\gamma_{G^*}$ = 1,00 | $\gamma_{G^*}$ = 1,00 |
| Variable | $\gamma_Q$ = 0,00 | $\gamma_Q$ = 1,50 | $\gamma_Q$ = 0,00 | $\gamma_Q$ = 1,00 |
| Accidental | - | - | $\gamma_A$ = 1,00 | $\gamma_A$ = 1,00 |

## 6.- Proceso constructivo.

El proceso constructivo a observar en la ejecución del proyecto que se presenta corresponde al lógico de la ejecución en primer lugar del capítulo de Movimiento de Tierras, posteriormente al de cimentación y finalmente al de la estructura, esta última realizada nivel a nivel, desde el más inferior al superior. De este proceso, hay que destacar que todo elemento estructural deberá mantenerse apuntalado hasta que éste haya alcanzado la resistencia prevista en el proyecto, y que nunca se solicitarán los elementos a situaciones de carga más desfavorables que las previstas en el proyecto, tal y como fijan los Pliegos de Condiciones adjuntos.

## 7.- Mantenimiento de la Estructura.

### 7.1.- Estructuras de acero.

Las estructuras de acero tradicionalmente son las que comportan mayor repercusión en cuanto a las tareas de mantenimiento, dada la mayor inestabilidad de su estructura molecular.

Básicamente, el mantenimiento deberá hacer frente a la oxidación y a la corrosión.

Por esto, hay que proteger la estructura de la intemperie. Así pues, hay que aplicar en todas las superficies expuestas una imprimación de pintura o producto antioxidante. Esta imprimación será objeto de un control periódico, con el fin de detectar posibles indicios de oxidación.

A tal efecto es preceptivo el cumplimiento del siguiente programa de actividades de mantenimiento:

a) La estructura metálica es interior o no expuesta a agentes ambientales nocivos. Deberá realizarse una revisión de la estructura cada 4 años, detectando puntos de inicio de oxidación, en los que deberá levantarse el material degradado y proteger la zona deteriorada mediante la imprimación local de pintura antioxidante.

   Cada 10 años deberá procederse a un levantamiento de la imprimación existente, realizado un posterior pintado total de la estructura.

b) La estructura metálica es exterior o queda en un ambiente de agresividad moderada. Deberá realizarse una revisión de la estructura cada 2 años, detectando puntos de inicio de la oxidación, en los que habrá que levantar el material degradado y proteger la zona deteriorada mediante la imprimación local de pintura antioxidante.

   Cada 5 años se deberá proceder a un levantamiento de la imprimación existente realizando un posterior pintado total de la estructura.

c) La estructura metálica es exterior en un ambiente de agresividad elevada. Deberá realizarse una revisión de la estructura cada año, detectando puntos de inicio de la oxidación, en los que deberá levantarse el material degradado y proteger la zona deteriorada mediante la imprimación local de pintura antioxidante.

   Cada 3 años deberá procederse a un levantamiento de la imprimación existente para un posterior pintado total de la estructura.

### 7.2.- Estructuras de hormigón.

Las partes de la estructura constituidas por hormigón armado deberán someterse, también a un programa de mantenimiento a lo largo del tiempo, de manera muy parecida al esbozo para la estructura metálica, ya que el mayor número de patologías del hormigón armado procede o se manifiesta al iniciarse el proceso de corrosión de sus armaduras.

De esta manera será necesario observar el siguiente programa de mantenimiento:

a) El elemento de hormigón es interior: será precisa una revisión de los elementos dos años después de haber sido construidos, y posteriormente establecer una revisión de los mismos cada 10 años, con el objeto de detectar posibles fisuraciones.

b) El elemento de hormigón es exterior o queda inmerso en un ambiente húmedo: en este caso será preceptiva una imprimación con resina epoxi de todos los paramentos después

de haberse completado el fraguado y realizar una revisión al cabo de un año y medio después de haberse construido.

Posteriormente, será preceptiva también una revisión cada 5 años, detectando fisuras y sellándolas con algún tipo de resina epoxi.

c) El elemento de hormigón queda expuesto a un ambiente de agresividad elevada: será precisa una imprimación con resina epoxi de todos sus paramentos después de haberse completado el fraguado, y proceder a una revisión al cabo de 6 meses después de haber sido construido.

Será preceptivo una revisión cada 2 años, así como una nueva imprimación de pintura epoxi cada 5 años, salvo justificación del fabricante de la resina de que este periodo de tiempo pueda ser mayor.

# MI. MEMÒRIA DE LES INSTAL·LACIONS

## MI.1 INSTAL·LACIÓ DE SANEJAMENT

ANTECEDENTS

La xarxa de sanejament és nova, per aquest motiu per a la realització dels nous trams es va a connectar a punts existents de la xarxa.

BASES DE DISSENY

D'una banda, es realitza la xarxa de sanejament d'aigües grises, la qual connecta tots els elements nous com els rentamans, vàters i dutxes. Juntament amb dos arquetes de dimensions de 90x60 centímetres que amb sifó de PVC de diàmetre segons el tram de connexionat, per separar les aigües de les dutxes amb les dels vàters. El traçat es realitza mitjançant clavegueró amb tub de PVC-U de paret massissa i soterrat. La xarxa de recollida d'aigües de les dutxes es realitza a través d'una canal de recollida d'aigües modular amb reixeta perforada d'acer galvanitzat. A la zona de recepció s'hi troba d'una arqueta de 150x60 centímetres amb sifó de PVC.

D'altra banda, també es durà a terme una xarxa de sanejament d'aigües pluvials amb clavegueró amb tub de PVC-U de paret massissa i soterrat. Aquest traçat estarà compost per boneres sifòniques a les cobertes dels nous volums per l'evacuació de les aigües pluvials, com també, dels respectius muntants. La recollida d'aigües pluvials a la resta de la urbanització s'ha dissenyat mitjançant pendents i a la zona inferior de les pendents col·locar punts de desguàs, els quals connecten en aquest mateix traçat; i del conjunt de: canal més reixa amb canal de formigó polímer i reixa d'acer galvanitzat de 200 mil·límetres i 374 mil·límetres de fondària, per a les zones edificades. Els filtres de depuració de les piscines tenen un traçat independent per ells, tanmateix, connecten amb aquest mateix recorregut mitjançant una arqueta de 150x60 centímetres. Disposa d'una arqueta de 150x60 centímetres amb sifó de PVC a la zona de l'entrada del recinte.

Cascun d'ambdós traçats va a connectar a la respectiva xarxa: pluvials o residuals existents.

La instal·lació es dissenya de forma que garanteixi les exigències bàsiques HS-5 del CTE i d'altres reglamentacions en quant a:

- traçat
- dimensionat
- manteniment

en les següents condicions:

| | |
|---|---|
| Traçat | El traçat i el pendent de la instal·lació faciliten l'evacuació de les aigües residuals i dels residus evitant-ne la retenció. El pendent és l'indicat a la documentació gràfica. |
| Dimensionat | La instal·lació es dimensiona per a transportar els cabals previsibles en condicions segures. |
| Manteniment | Es dissenya de forma que siguin accessible. |

El traçat, característiques i dimensionat s'indica als plànols.

Així doncs, la instal·lació constarà de la realització del nou traçat de la xarxa de sanejament horitzontal.

MATERIALS

El material utilitzat per la xarxa de sanejament serà canonada de PVC segons normes UNE EN 1329-1:1999, UNE EN 1401-1:1998, UNE EN 1435-1:2000, UNE EN 1456-1:2002, UNE EN 1566-1:1999, amb accessoris d'unió del mateix material mitjançant junta elàstica amb gruix mínim de paret SDR24 i rigidesa anul·lar nominal SN4. Aquest material permet profunditats d'enterrament importants i sobrecàrregues de pes per tràfic rodat per la seva elevada resistència a l'aixafada i a les deformacions.

El material emprat per als desguassos, baixants, desplaçaments i col·lectors penjats de la xarxa de sanejament serà PVC-U de paret massissa, àrea d'aplicació B segons norma UNE-EN 1329-1, amb accessoris d'unió mitjançant junta elàstica o encolats del mateix material. Pel conjunt de col·lectors soterrats serà amb tub de PVC-U de paret massissa per a sanejament sense pressió, de DN segons convingui i de SN 4 (4 kN/m2) de rigidesa anular, segons norma UNE-EN 1401-1.

MÈTODE DE CÀLCUL

Flux en les Conduccions Horitzontals.

El Flux en les canonades horitzontals de desguàs depèn de la força de gravetat que és induïda per la pendent de la canonada i l'alçada de l'aigua en ella.

La formulació del flux per gravetat, en condicions estacionàries, la podem tenir mitjançant l'equació de Manning:

$$V = 10^{-3} \cdot \frac{R^{2/3} \cdot J^{1/2}}{n}$$

On:

V = velocitat del flux, en m/s.

R = Profunditat hidràulica mitja o radi hidràulic, en mm.

J = Pendent de la canonada en % (ó cm/m)

n = Coeficient de Manning.

Si tenim en comte que el cabal és igual a:

$$Q = S \cdot V$$

On:

S = Superfície transversal del flux d'aigua en m2.

Q = Cabal volumètric en m3/s.

Al combinar les dues equacions anteriors, tindrem:

$$Q = 10^{-3} \cdot \frac{S}{n} \cdot R^{2/3} \cdot J^{1/2}$$

Flux en les Conduccions Verticals.

El flux d'aigua en conduccions verticals depèn essencialment del cabal. A l'entrada d'un ramal a la columna, l'aigua és accelerada per la força de gravetat i, ràpidament, forma una làmina al voltant de la superfície interna de la columna. Aquesta corona circular d'aigua i l'ànima d'aire en el seu interior continuen accelerant-se fins que les pèrdues per fricció contra la paret igualen la força de gravetat. Des d'aquest moment, la velocitat de caiguda queda pràcticament constant.

D'aquesta manera, podem definir la velocitat terminal i la distància del punt d'entrada d'aigua a la qual s'arriba a aquesta velocitat de la següent forma:

$$V_T = 10 \cdot \left( \frac{Q}{D} \right)^{0.4}$$

$$L_T = 0.17 \cdot V_T^2$$

On:

VT és la velocitat terminal en m/s.

LT és la distància terminal en m.

Q és el cabal en L/s.

D és el diàmetre interior en mm.

El cabal d'aigua pot expressar-se en funció del diàmetre de la canonada "D" i de la relació "r" entre la superfície transversal de la làmina d'aigua i la superfície transversal de la canonada mitjançant l'expressió:

$$Q = 3.15 \cdot 10^{-4} \cdot r^{5/3} \cdot D^{8/3}$$

CÀLCUL I DIMENSIONAT

S'utilitzarà el mètode d'adjudicació d'un número d'unitats de desguàs (UD) a cada aparell sanitari i es considerarà l'aplicació del criteri de simultaneïtat estimant el que el seu ús sigui públic o privat.

Dimensionat de la xarxa d'evacuació d'aigües fecals

Derivacions individuals

L'adjudicació d'UDs a cada tipus d'aparell i els diàmetres mínims de sifons i derivacions individuals s'estableixen en funció de l'ús privat o públic segons la taula següent:

| Tipus d'aparell sanitari | Unitats de desguàs UD | Diàmetre mínim sifó i derivació individual (mm.) |
|---|---|---|

| | Ús privat | Ús públic | Ús privat | Ús públic |
|---|---|---|---|---|
| Lavabo i pileta | 1,0 | 2,0 | 32,0 | 40,0 |
| Bidet | 2,0 | 3,0 | 32,0 | 40,0 |
| Dutxa | 2,0 | 3,0 | 40,0 | 50,0 |
| Banyera amb dutxa | 3,0 | 4,0 | 40,0 | 50,0 |
| Poliban | 3,0 | -- | 40,0 | -- |
| Inodor amb cisterna | 4,0 | 5,0 | 100,0 | 100,0 |
| Inodor amb fluxòmetre | 8,0 | 10,0 | 100,0 | 100,0 |
| Placa turca | -- | 8,0 | -- | 100,0 |
| Rentacunyes | -- | 6,0 | -- | 80,0 |
| Aigüera de cuina | 3,0 | 6,0 | 40,0 | 50,0 |
| Abocador | 8,0 | 8,0 | 100,0 | 100,0 |
| Bonera sifònica | 1,0 | 3,0 | 40,0 | 50,0 |
| Rentavaixelles | 3,0 | 6,0 | 40,0 | 50,0 |
| Rentadora | 3,0 | 6,0 | 40,0 | 50,0 |
| Cambra de bany (lavabo, inodor amb cisterna, banyera i bidet) | 7,0 | -- | 100,0 | -- |
| Cambra de bany (lavabo, inodor amb fluxòmetre, banyera i bidet) | 8,0 | -- | 100,0 | -- |
| Cambra de bany (lavabo, inodor amb cisterna i Polibàn) | 6,0 | -- | 100,0 | -- |

| Tipus d'aparell sanitari | Unitats de desguàs UD | | Diàmetre mínim sifó i derivació individual (mm.) | |
|---|---|---|---|---|
| | Ús privat | Ús públic | Ús privat | Ús públic |
| Cambra de bany (lavabo, inodor amb fluxòmetre i Polibàn) | 8,0 | -- | 100,0 | -- |
| Humidificador | 4,0 | 4,0 | 40,0 | 40,0 |

Pots sifònics o sifons individuals

Els sifons individuals tindran el mateix diàmetre que la vàlvula de desguàs connectada.

Els pots sifònics es triaran en funció del nombre i mides de les entrades i amb l'alçada mínima recomanada per evitar que la descàrrega d'un aparell sanitari alt surti per un altre de menor alçada.

Ramals col·lectors

S'utilitzarà la taula següent pel dimensionat de ramals col·lectors entre aparells sanitaris i la baixant segons el nombre màxim d'unitats de desguàs i la pendent del ramal col·lector.

| Diàmetre mm. | Màxim nombre de Uts | | |
|---|---|---|---|
| | Pendent 1 % | Pendent 2 % | Pendent 4 % |
| 32 | -- | 1 | 1 |
| 40 | -- | 2 | 3 |
| 50 | -- | 6 | 8 |
| 63 | -- | 11 | 14 |
| 75 | -- | 21 | 28 |
| 90 | 47 | 60 | 75 |
| 110 | 123 | 151 | 181 |
| 125 | 180 | 234 | 280 |
| 160 | 438 | 582 | 800 |
| 200 | 870 | 1150 | 1680 |

Baixants d'aigües residuals

El dimensionat de les baixants es farà d'acord amb la taula següent on es fa correspondre el nombre de plantes de l'edifici amb el nombre màxim d'UD's i el diàmetre que li correspondria al baixant, coneixent que el diàmetre de la mateixa serà únic en tota la seva alçada i considerant també el màxim cabal que pot descarregar al baixant des de cada ramal sense contrapressions en aquest.

| Diàmetre mm. | Màxim nombre d´Unitats, per una alçada de baixant de: | | Màxim nombre d´Unitats, en cada ramal per una alçada de baixant de: | |
|---|---|---|---|---|
| | Fins 3 plantes | Més de 3 plantes | Fins 3 plantes | Més de 3 plantes |
| 50 | 10 | 25 | 6 | 6 |
| 63 | 19 | 38 | 11 | 9 |
| 75 | 27 | 53 | 21 | 13 |
| 90 | 135 | 280 | 70 | 53 |
| 110 | 360 | 740 | 181 | 134 |
| 125 | 540 | 1100 | 280 | 200 |
| 160 | 1208 | 1120 | 400 | 160 |
| 200 | 2200 | 3600 | 1680 | 600 |
| 250 | 3800 | 5600 | 2500 | 1000 |
| 315 | 6000 | 9240 | 4320 | 1650 |

Col·lectors horitzontals d'aigües residuals

Mitjançant la utilització de la Taula següent, obtenim el diàmetre en funció del màxim nombre d'UDs i de la pendent.

| Diàmetre mm. | Màxim nombre de Unitats | | |
|---|---|---|---|
| | Pendent 1 % | Pendent 2 % | Pendent 4 % |
| 50 | -- | 20 | 25 |
| 63 | -- | 24 | 29 |
| 75 | -- | 38 | 57 |
| 90 | 96 | 130 | 160 |
| 110 | 264 | 321 | 382 |
| 125 | 390 | 480 | 580 |
| 160 | 880 | 1056 | 1300 |
| 200 | 1600 | 1920 | 2300 |
| 250 | 2900 | 3500 | 4200 |
| 315 | 5710 | 6920 | 8290 |
| 350 | 8300 | 10000 | 12000 |

<u>Dimensionat de la xarxa d'evacuació d'aigües pluvials</u>

Xarxa de petita evacuació d'aigües pluvials.

El dimensionat de la xarxa d'evacuació d'aigües pluvials s'establirà en funció dels valors d'intensitat, duració i freqüència de la pluja segons la informació obtinguda per la localitat corresponent.

Baixants d'aigües pluvials

El diàmetre corresponent a la superfície, en projecció horitzontal, servida per cada baixant d'aigües pluvials s'obtindrà de la taula següent:

| Diàmetre nominal baixant (mm) | Superfície en projecció horitzontal servida, m2 (Im = 100mm/h) | Superfície en projecció horitzontal servida, m2 (Im = 155,81mm/h) |
|---|---|---|
| 50 | 65 | 41,72 |
| 63 | 113 | 72,52 |
| 75 | 177 | 113,60 |
| 90 | 318 | 204,09 |
| 110 | 580 | 372,25 |
| 125 | 805 | 516,65 |
| 160 | 1544 | 990,95 |
| 200 | 2700 | 1.732,88 |

Col·lectors d'aigües pluvials.

S'utilitzarà la taula següent que relaciona la superfície màxima projectada admissible amb el diàmetre i la pendent del col·lector.

| Diàmetre nominal del col·lector (mm.) | Màx. Superfície de coberta en projecció horitzontal m2 (Im=100mm/h) | | | Màx. Superfície de coberta en projecció horitzontal m2 (Im=155,81mm/h) | | |
|---|---|---|---|---|---|---|
| | Pendent 1% | 2% | 4% | 1% | Pendent 2% | 4% |
| 90 | 125 | 178 | 253 | 80,23 | 114,24 | 162,38 |
| 110 | 229 | 323 | 458 | 146,97 | 207,30 | 293,95 |
| 125 | 310 | 440 | 620 | 198,96 | 282,40 | 397,92 |
| 160 | 614 | 862 | 1228 | 394,07 | 553,24 | 788,14 |
| 200 | 1070 | 1510 | 2140 | 686,73 | 969,13 | 1.373,47 |
| 250 | 1920 | 2710 | 3850 | 1.232,27 | 1.739,30 | 2.470,96 |
| 315 | 3090 | 4589 | 6500 | 1.983,18 | 2.945,25 | 4.171,75 |

Accessoris

Dimensionat d'arquetes.

A la taula següent es donen les dimensions mínimes necessàries (Longitud L i amplada A mínimes) d'una arqueta segons el diàmetre del col·lector de sortida d'aquesta:

| Descripció | Diàmetre del col·lector de sortida (mm) | Llarg (m) | Ample (m) |
|---|---|---|---|
| | | | |
| 40x40 | 100,00 | 0,40 | 0,40 |
| 50x50 | 150,00 | 0,50 | 0,50 |
| 60x60 | 200,00 | 0,60 | 0,60 |
| 60x70 | 250,00 | 0,60 | 0,70 |
| 70x70 | 300,00 | 0,70 | 0,70 |
| 70x80 | 350,00 | 0,70 | 0,80 |
| 80x80 | 400,00 | 0,80 | 0,80 |
| 80x90 | 450,00 | 0,80 | 0,90 |
| 90x90 | 500,00 | 0,90 | 0,90 |

SISTEMA VERTICAL I CONNEXIONS

El material emprat per a la xarxa de baixants serà el tub de PVC-U.

El sistema de sanejament vertical estarà composat per baixants que recolliran les aigües pluvials. Com es pot comprovar a la documentació gràfica.

SISTEMA HORITZONTAL I CONNEXIONS

La xarxa horitzontal d'evacuació realitza el seu recorregut soterrat per la planta baixa de l'edifici.

Es connectaran a la mateixa els trams de la xarxa corresponent als diferents elements. És a dir, cadascun dels baixants, així com també tots els elements.

La pendent dels col·lectors, serà emprant coma mínim l'1 ,5% per millorar i facilitar l' evacuació.

## MI.2 INSTAL·LACIÓ DE FONTANERIA

### ANTECEDENTS

Com ja s'ha anomenat l'escomesa no és existent i, per tant, es va a connectar els nou traçat de la xarxa a la xarxa de distribució existent.

### DESCRIPCIÓ DEL PROJECTE

Pel que respecta a fontaneria es realitzaran dos connexions noves a la xarxa de distribució, una pel servei de les piscines i les noves volumetries i una altra pel servei del bar, ja que es considera que no estarà gestionat per la propietat, sinó que serà una concesió.

La xarxa de subminsitrament del recurs hídric a les piscines es composarà primerament per una arqueta d'escomesa d'aigua per a la connexió a la xarxa de companyia de 80 centímetres d'amplada i 1 metre de longitud, que inclou: vàlvula de tall, vàlvula antiretorn, presa de mostra, comptador, filtre i vàlvula de tall. El traçat principal és de canonades soterrades d'aigua freda santiària de polipropilè, la qual abasteix el vas de compensació de cada piscina, les dutxes exteriors i els vestidors. Com hi ha dos zones de dues dutxes exteriors, cadascuna de les derivacions contindrà una arqueta d'escomesa d'aigua de companyia de 38x38 centímetres que inclou la vàlvula de tall per sectoritzar-les. Les connexions a cada vas de compensació consta de vàlvula motoritzada, vàlvula de tall, comptador i vàlvula antiretorn, juntament amb els elements de passa-murs de la planta soterrani, l'espai de la sala de màquines. Les derivacions del traçat principal a cada vestidor es realitza amb canonada soterrada d'aigua freda sanitària de coure; una canonada per cada vestidor. El recorregut per l'interior dels vestidors és amb canoanda de coure aïllada sota forjat. Per la producció d'aigua calenta sanitària (ACS) es diposa d'un escalfador acumulador elèctric de 200 litres de capacitat, horitzontal i situat al fals sostre proper a les dutxes, ja que son l'únic element que en requereix. Les canonades seran de coure aïllat i transcorreran per sota el forjat. D'una banda, al volum del vestuari 1 s'instal·laran: tres vàters, un d'ells adaptat, un abocador, quatre rentamans, un d'ells adaptat i cinc dutxes. D'altra banda, al volum del vestuari 2 s'instal·laran: quatre vàters, un d'ells adaptat, cinc rentamans, un d'ells adaptat i cinc dutxes.

La xarxa d'aigua freda sanitària (AFS) del bar tindrà el seu propi subministrament separat del principal, com s'ha mencionat anteriorment, comportant una vàlvula de tall a la sala d'instal·lacions connectada a un armari metàl·lic amb tanca normalitzada de 800x600x300 mil·límetres, a l'espai del magatzem amb vàlvula antiretorn, presa de mostra, comptador, filtre i vàlvula de tall. La producció d'ACS serà mitjançant un escalfador acumulador elèctric de 50 litres de capacitat vertical. Les canonades seran de coure, mentres que les soterrades no aniran aïllades com les de sota forjat. Aquesta instal·lació subministrarà aigua a dos aigüeres i un punt de connexionat per a la cafetera.

Cada element terminal disposa de les claus de tall corresponents per la sectorització de la unitat.

### MATERIAL DE LA INSTAL·LACIÓ INTERIOR

La distribució interior ha estat prevista en coure.

El coure s'ha dissenyat tant per la distribució interior conjunta com per les derivacions a cadascun dels aparells sanitaris.

Les canonades d'aigua freda i calenta, estaran aïllades amb espuma elastomèrica amb el seu gruix corresponent segons indicacions del RITE.

### AÏLLAMENT

Serà d'obligat compliment instal·lar els gruixos indicats en la Documentació Gràfica.

Cal que totes les canonades destinades a transport d'aigua freda vagin convenientment aïllades amb "coquilla" elastomèrica.

CRITERIS DE TRAÇAT

Les canonades aniran en els recorreguts generals sota forjat o pels doblats de les parets, sempre que sigui possible, i encastades en les baixades. Inclòs en aquest darrer cas sempre aniran aïllades amb coquilla.

DISTÀNCIA AMB LA RESTA D'INSTAL·LACIONS

Es compliran en tot cas les distàncies mínimes que estableix el CTE entre les canalitzacions d'aigua i les altres instal·lacions.

CRITERIS DE SUBJECCIÓ

Tots els suports seran abraçadores tipus isofòniques, d'acer galvanitzat amb junta de goma que impedeixi a la canonada ser malmesa pel propi suport. El seu ancoratge i tac de subjecció estarà en relació al pes de la canonada. Les distàncies màximes entre suportacions s'ajustaran a la taula següent:

| TUB DE PLÀSTIC DN EN mm | SEPARACIÓ MÀXIMA ENTRE SUPORTACIONS | |
|---|---|---|
| | TRAM VERTICAL | TRAM HORITZONTAL |
| DN > 10 | 0.90 m | 0.60 m |
| 16 DN < 25 | 1.20 m | 0.90 m |
| 32 DN < 50 | 1.50 m | 1.20 m |
| 63 DN < 125 | 1.80 m | 1.50 m |

TRACTAMENTS CORRECTORS DE L'AIGUA

Amb el subministrament general d'aigua de la companyia no es preveu cap tractament corrector de l'aigua sanitària de consum.

SECTORITZACIONS

En cada derivació hi haurà sempre vàlvules de tall tipus esfera i també en cada entrada a recinte humit. Cada aparell sanitari que ho permeti (rentamans, piques, inodors), anirà connectat amb flexos i incorporarà sempre una vàlvula tipus escaire per a poder tallar-li el subministrament d'aigua en cas de necessitat.

CÀLCULS JUSTIFICATIUS

Coeficients de simultaneïtat

Els cabals unitaris de cada aparell són els que venen donats pel Codi Tècnic de l'Edificació, corregits pels coeficients de simultaneïtat donats per l'expressió:

$$K = \frac{1}{\sqrt{(n-1)}}$$

Essent "n" el número d'aparells penjats en el tram que es calcula.

El cabal de càlcul vindrà donat per:

$$Q_c = K \cdot Q_i$$

Essent Qc el cabal de càlcul i Qi l'instal·lat.

CONSUMIDORS D'AIGUA

Els consumidors d'aigua de l'edifici s'han dimensionat per el cabal que marca el codi tècnic. A continuació presentem la taula resum:

| Tipo de aparato | Caudal instantáneo mínimo de agua fría [$dm^3/s$] | Caudal instantáneo mínimo de ACS [$dm^3/s$] |
|---|---|---|
| Lavamanos | 0,05 | 0,03 |
| Lavabo | 0,10 | 0,065 |
| Ducha | 0,20 | 0,10 |
| Bañera de 1,40 m o más | 0,30 | 0,20 |
| Bañera de menos de 1,40 m | 0,20 | 0,15 |
| Bidé | 0,10 | 0,065 |
| Inodoro con cisterna | 0,10 | - |
| Inodoro con fluxor | 1,25 | - |
| Urinarios con grifo temporizado | 0,15 | - |
| Urinarios con cisterna (c/u) | 0,04 | - |
| Fregadero doméstico | 0,20 | 0,10 |
| Fregadero no doméstico | 0,30 | 0,20 |
| Lavavajillas doméstico | 0,15 | 0,10 |
| Lavavajillas industrial (20 servicios) | 0,25 | 0,20 |
| Lavadero | 0,20 | 0,10 |
| Lavadora doméstica | 0,20 | 0,15 |
| Lavadora industrial (8 kg) | 0,60 | 0,40 |
| Grifo aislado | 0,15 | 0,10 |
| Grifo garaje | 0,20 | - |
| Vertedero | 0,20 | - |

## MI.3 INSTAL·LACIÓ DE DEPURACIÓ

ANTECEDENTS

No hi ha cap antecedent de instal·lació de depuració de piscines en l'àmbit del projecte.

OCUPACIÓ

Els càlcula corresponents a l'ocupació s'han realitzat basats en les dades facilitades per l'Ajuntament de Llinars del Vallés, i es descriuen a continuació:

| | |
|---|---|
| Entrades menors de 14 anys laborables | 539 |
| Entrades majors de 14 anys laborables | 828 |
| Entrades tarda laborables (a partir de les 15:00) | 3.135 |
| Entrades menors de 3 anys | 2 |
| Entrades tarda laborables (a partir de les 15:00) – Masoveria | 138 |
| Abonaments 10 banys | 124 x 10 |
| Abonament de 20 banys | 30 x 20 |
| Abonament mensual | 1 |
| Casals i Esplais | 1.248 |
| Menors de 16 i a partir de 65 | 7 |
| Menors de 16 i a partir de 65 (descompte germà) | 2 |
| Menors de 16 i a partir de 65 setmana | 10 |
| Menors de 16 i a partir de 65 (descompte germà) | 2 |
| TOTAL | 7.752 |

11 Setmanes (entre el 16 de juny i el 31 d'agost)
5 dies laborals per setmana

TOTAL = 7.752 / 11 / 5 = 141 persones / dia

DESCRIPCIÓ DEL PROJECTE

El projecte contempla la instal·lació d'un nou sistema de depuració per a les dues piscines noves en una sala de màquines, entre les dues piscines.

La piscina gran disposarà de 3 filtres de depuració connectats en paral·lel, el seu propi vas de compensació, tres bombes de circulació de plàstic, dues bombes dosificadores (PH i hipoclorit) i els elements tant d'impulsió com extracció de l'aigua de la piscina. Concretament, disposarà de 2 preses de fons, 2 neteja fons i 15 boques d'impulsió.

La piscina petita disposarà d'un filtre de depuració, el seu propi vas de compensació, una bomba de circulació de plàstic, dues bombes dosificadores (PH i hipoclorit) i els elements tant d'impulsió com extracció de l'aigua de la piscina. Concretament, disposarà de 2 preses de fons, 1 neteja fons i 6 boques d'impulsió.

Ambdós piscines tindran el seu propi sistema de control i dosificació tant del PH com de la cloració, mitjançant un equip automàtic digital tàctil de regulació i control de la marca: Astralpool i model: Guardian Pool 74720 o equivalent. Tant el PH com l'hipoclorit disposa d'un dipòsit APQ de paret doble de 1.000 litres de capacitat i 1.350 mil·límetres de diàmetre i 1.725 mil·límetres d'alçada., el qual estarà connectat amb els sistemes d'impulsió de cada piscina mitjançant les bombes dosificadores. Aquestes, controlades per l'equip de control prèviament esmenat.

Cada filtre tindrà el propi equip de floculació.

FILTRATGE

En tots els casos el filtratge es farà a través d'un filtre monocapa vertical de fibra de polièster i fibra de vidre de 1.400 mil·límetres de diàmetre i 1.755 mil·límetres d'alçada. En tot cas els filtres seran independents a base de claus per a possibles reparacions, i a través d' un joc de vàlvules permetran invertir el cicle per a la neteja del mateix filtre. Quan es faci aquesta operació un altre joc de vàlvules permetrà enviar l'aigua a claveguera. Aquesta operació es fa de manera manual.

El sistema es composa en tots els casos d' un grup de bombeig. Seran de corba tensa, és a dir, que per una variació ostensible de la resistència oposada pels filtres quan estiguin bruts, no alteri excessivament el cabal d'aigua que impulsen. Els seus rendiments seran tals que puguin treballar adequadament els diferent processos de neteja de filtres, filtració, etc. Haurà de treballar sempre amb els mateixos cabals, sense haver de precisar incorporació d' aigua o de aire. És un sistema que estarà en funcionament les 24 hores del dia, sense bomba de reserva. Aquest grup aspira del col·lector on descarreguen totes les extraccions. Cadascun dels elements a realitzar manteniment estarà separat mitjançant vàlvules de tall. Les vàlvules i elements de la depuració de la piscina seran de plàstic per evitar corrosions i mal funcionaments degut a la presencia del clor en les canonades.

El filtre tindrà en el seu interior un sistema de repartiment homogeni, amb un col·lector intern de repartiment en forma de engraellat. L'element filtrant a l'interior del dip`soit seran sorres tipus Silex d'entre 0,4 i 2 mil·límetres de diàmetre. Tant el col·lector com les vàlvules seran de PVC, amb brides de connexió segons normes UNE i DIN. Les vàlvules seran totes elles de papallona.

Per impulsar l' aigua a través d' ells es disposarà de 4 bombes en total d'iguals característiques però règims de funcionament diferents; una d'elles per la piscina petita i les altres 3 per la piscina gran, amb arrencament en Estrella - Triangle.

Les característiques dels filtres emprats son les següents:

| Marca | Model | Dimensions | Número d'unitats | Superfície de filtració |
|---|---|---|---|---|
| | | Ø x Alçada | | (m3/h) |
| AstralPool | Praga o equivalent | 1.400x1.755 mm | 4 | 1,54 |

BOMBEIG

Els equips de bombeig es classifiquen segons les bombes de circulació del cabal de les piscines o les bombes dosificadores de PH i hipoclorit.

Les bombes de circulació tant de la piscina petita com la gran son de plàstic i el mateix model, però amb règims de treball diferents, a continuació es mostra:

| Marca | Model | Número d'unitats | Cabal d'aigua |
|---|---|---|---|
| | | | (m3/h) |
| AstralPool | KIVU 3 CV o equivalent | 3 | 68 |
| AstralPool | KIVU 3 CV o equivalent | 1 | 25 |

Les bombes dosificadores de PH i hipoclorit tenen les següents especificacions:

| Marca | Model | Referència | Número d'unitats | Cabal d'aigua |
|---|---|---|---|---|
| | | | | (l/h) |
| AstralPool | ACQUA DOS o equivalent | 75088 | 3 | 5 |
| AstralPool | ACQUA DOS o equivalent | 75089 | 1 | 10 |

ELEMENTS

Els elements necessaris per al funcionament de les piscines es composen per: boques d'impulsió, neteja fons, presa de fons, vas de compensació i canonades.

- Les boques d'impulsió es situen en el fons de la piscina i és un fons oscil·lant, formada per un cos oscil·lant en PVC, tapa tipus ABS i cargol regulador a pom. El cabal és de 10 $m^3$/h del model: 22353 de la marca: Fluidra o equivalent. A la piscina gran estan distribuïts 15 unitats i a la petita 6 unitats.

- Els broquets d'aspiració son de rosca exterior de 2'' i diàmetre interior de 50 mil·límetres, amb pressió màxima de 6 bar. Construït amb plàstic ABS de color blanc amb tap de rosca 1 ½'' del model: 00301 de la marca: Fluidra o equivalent. A la piscina gran estan distribuïts 2 unitats i a la petita 1 unitat.

- La presa de fons està constituïda per una bonera de polièster de dimensions 515x515 mil·límetres i 140 mil·límetres de diàmetre de plàstic ABS i acabat amb Gel-Coat i del model: 28711 de la marca: Fluidra o equivalent. Ambdues piscines disposen de 2 unitats cadascuna.

- El vas de compensació serà d'obra i les dimensions del necessari de la piscina gran és de 4 metres de profunditat i 3,10 metres de longitud per 3,6 metres d'alçada. El vas de la piscina petita tindrà les dimensions de 4 metres de profunditat i 1 metre de longitud per 3,6 metres d'alçada. El nivell el qual estarà l'aigua és de 2,5 metres, ja que s'ha considerat una entrada al vas pel manteniment de 60x60 centímetres i un marge de 20 centímetres d'alçada d'aigua.

- Les canonades emprades per cada tram de depuració té el seu propi diàmetre, veure la documentació gràfica. Les canonades seran de PVC PN10 amb els respectius accessoris i si és necessari o no ancoratges. El clavegueró de sanejament dels filtres i diferents elements empraran PVC-U de paret massissa. La canonada de subministrament d'aigua freda sanitària al vas de compensació serà de polipropilè, juntament amb els diferents elements de control com: vàlvula motoritzada, clau de tall, comptador i vàlvula antiretorn.

- Es dotaran de sis salvavides de plàstic de 730 mil·límetres de diàmetre exterior amb suport d'acer inoxidable en total i propers a les piscines de referències: 01369+01370 de la marca: Fluidra o equivalent .

- Les quatre unitats d'escales de la piscina gran estaran compostes per una part inferior d'escala partida de dos graons i joc de passamans en tub de 43 mil·límetres d'acer inoxidable AISI-316 de referències: 08091+05540 de la marca: Fluidra o equivalent.

## MI.4 INSTAL·LACIÓ DE IL·LUMINACIÓ

### ANTECEDENTS

No es disposa d'il·luminació en l'àmbit del projecte.

### ENLLUMENAT FUNCIONAL

Les zones comuns de circulació disposaran d'enllumenat funcional i es garantiran els nivell mínims d'il·luminació següents (d'acord al DB SUA-4):

- Zones de circulació interiors E ≥ 100 lux

Els valors d'eficiència energètica de la instal·lació d'il·luminació (VEEI) garanteixen els fixats pel DB HE3, i es concreten en:

- Recintes interiors no descrits al llistat VEEI ≤ 4 W/m2

### DISSENY I POSADA EN OBRA

La il·luminació dels nous volums serà nova, per tal de que sigui la més adient possible als espais generats. També es disposarà de la llum d'emergència corresponent, estanca amb làmpada LED i autonomia de 1h i 450 lumens, del model: HYDRAG P8 de la marca: Daisalux o equivalent.

Generalment pel que fa als espais de: recepció, sala d'oficines, vestuaris, lavabos, sala de neteja i sala del quadre elèctric s'instal·laran llumeneres de superfície adossades a les parets de potències compreses entre 17 W a 61 W, flux lluminós comprés entre 1.460 lm i 5.265 lm, amb grau de protecció IP 54, 3.000K de temperatura de color i amb carcassa de perfil d'alumini anoditzat amb acabat blanc, juntament amb difusor de policarbonat esmerilat i tapes d'alumini de 5 mil·límetres, en base a la longitud de l'espai, del model: U60 de la marca: OM o equivalent. A la sala de màquines de màquines de la planta soterrani es disposaran de 9 llumeneres adossades a la paret de tipus LED estanca de policarbonat, de 23,5W de potència, 2.900 lumens de flux lluminós, protecció IP65, muntada superficialment, d'alçada 96 mil·límetres, d'amplada 87 mil·límetres i longitud 1.250 mil·límetres de la marca Philips i model: Coreline Estanca G2 o equivalent.

L'enllumenat exterior constarà de tres zones diferenciades: la zona de la pèrgola, la zona dels arbres i la zona de les piscines.

Primerament, a la zona exterior d'accés als vestidors, concretament a la zona superior de les pèrgoles s'introduirà per cadascuna una tira LED flexible de 220V, grau de protecció IP67, de 15 W/m de potència, marca: B.LED, model: B1535-BF o equivalent amb perfil d'alumini per encastar amb difusor i tapes al final de la marca: B.LED i model: PXG-205 o equivalent.

Seguidament, l'espai de vegetació dels arbres, cadascun d'ells tindrà un focus tipus LED de jardí orientable, de grau de protecció IP65, de 12 W de potència, 3.000 K, 73 mil·límetres d'amplada i 255 mil·límetres d'alçada de la marca: V-TAC i model: VT-857 o equivalent.

Finalment, la il·luminació de les piscines consistirà en dos bàculs, els quals cadascun disposarà de quatre projectors diferentment orientats. Aquests projectors son estancs de tipus LED per l'exterior, grau de protecció IP66, 200W de potència, 3.000K i de dimensiones: 418x3330x330 mil·límetres, de la marca: Gewiss, model: Elia FL i de referència: GWF1100ZC830 o equivalent. El bàcul consistirà en una columna cilíndrica de 7,5 metres d'alçada i 127 metres de diàmetre, placa d'ancoratge quadrada de 10 mil·límetres de gruix amb 4 cartel·les de reforç i 4 perns de M25.

MATERIALS I EQUIPS

Els materials i equips compliran les condicions establertes a les Instruccions corresponents del REBT i altres especificacions que li siguin d'aplicació.

El grau de protecció de les lluminàries serà l'adequat al lloc en que s'ubica. Les llumeneres exteriors seran estanques amb un mínim d'IP65 i les lluminàries interiors un grau de protecció IP54, degut a que son zones humides.

DIMENSIONAT

La instal·lació d'il·luminació es projecta de manera que garanteixi els valors de luminància mitja, l'eficiència energètica límit de la instal·lació (VEEI) i la potència màxima d'il·luminació instal·lada.

Per al càlcul de la luminància mitja s'utilitza el mètode del flux i la justificació del valor VEEI es fa segons les prescripcions del DB HE-3 "Eficiència energètica de les instal·lacions d'il·luminació".

## MI.5 INSTAL·LACIÓ ELÈCTRICA

### ANTECEDENTS

Actualment no existeix una xarxa elèctrica per a la superfície d'actuació del projecte, degut a que no està edificat.

DESCRIPCIÓ DEL PROJECTE

Es realitzarà un nou Quadre General de Distribució (Q.G.D.) a l'espai anomenat: sala de quadre elèctric, que estarà connectat amb un nou equip de mesura (EM) al mateix espai que el Q.G.D., TMF-01, i una nova Caixa General de Protecció (CGP) a l'exterior de l'àmbit de projecte, tipus 100, amb talla circuits de seguretat segons les indicacions de la companyia. Del Q.G.D. penjaran tots els circuits: d'enllumenat, força, ventilació i producció d'ACS dels nous volums, així com també el nou Quadre Secundari de Depuració (Q.S.D.). El Quadre Secundari de Depuració estarà situat a la sala de màquines de la planta soterrani, el qual alimentarà: enllumenat, l'endoll de la sala, les bombes de circulació del circuit de depuració de les piscines, els elements de control de floculació de cada filtre i les bombes de dosificació d'hipoclorit i control del PH.

El bar tindrà un quadre separat de la resta, com s'ha fet prèviament amb la xarxa de fontaneria, és a dir, disposarà d'un Quadre General de Distribució del Bar (Q.G.D.B.) ubicat a l'interior de la cuina, del qual penjaran els circuits d'enllumenat, dels endolls i del acumulador tèrmic elèctric de producció d'ACS. També s'instal·larà una Caixa de Protecció i Mesura (CPM) del tipus: CPM-MF-4 amb talla circuits de seguretat segons les indicacions de la companyia.

Els quadres estaran conformats per les línies i les proteccions establertes en els esquemes unifilars que conformen el projecte.

Pel que fa a la distribució dels diferents mecanismes s'instal·laran endolls a cadascun dels diferents espais i a les taules de recepció i de les oficines dos punts de treball per a cada estança compostos de: quatre presses de corrent, dos de SAI i dos de dades. A la sala d'oficines també s'hi trobarà el rack de dades i el Sistema d'Alimentació Ininterrompuda (SAI). El rack estarà en un armari metàl·lic mural per a sistemes de transmissió de veu, dades i imatge, amb bastidor de tipus rack 10'', de 4 unitats d'alçària, 310 mil·límetres d'amplària i 200 mil·límetres de fondària; amb porta de vidre amb pany i clau, fixat al parament amb switch 16 ports i panell integrat fix equipat amb 16 connectors RJ45 categoria 6A. El SAI és del tipus: line interactive de 600 VA de potència, temps d'autonomia de 10 minuts, tensió d'entrada/sortida: 230V/230V, freqüències de funcionament 50/60 Hz, amb dos presses de corrent del Schuko i protecció.

Als torns d'entrada s'ha considerat dos sortides de fils per aquests elements.

Les diferents màquines com ventiladors, acumuladors tèrmics elèctrics i bombes tindran el seu punt de connexió segons el circuit corresponent.

### CARACTERÍSTIQUES DEL SUBMINISTRAMENT EN BAIXA TENSIÓ

El subministrament es realitzarà a través de cables procedents de la xarxa de distribució pública de la Companyia.

Les característiques del subministrament de la instal·lació existent són:

| | |
|---|---|
| Tensió nominal | 3x400V |
| Freqüència | 50 Hz |

### CRITERIS DE DISSENY

Els criteris generals de disseny per l'elaboració d'aquest projecte elèctric són:

- Instal·lació del Quadre General de Distribució (Q.G.D.) amb l'Equip de Mesura (E.M.) i Caixa General de Protecció (C.G.P.) corresponent .

- Instal·lació del Quadre General de Distribució del Bar (Q.G.D.B) i la Caixa de Protecció i Mesura (C.P.M.) corresponent.

- Dotar de punts de connexió dels diferents elements elèctrics necessaris per l'ús de les instal·lacions.

- Realització de xarxa de terres amb piquetes, soldadures aluminotèrmica i cables pertinents als elements metàl·lics de l'àmbit de projecte.

- Reducció de pèrdues de potència en les línies elèctriques mitjançant un exhaustiu control de les caigudes de tensió.

- Utilització de cables i tubs no propagadors de flama, incendi i molt baixa emissió de fums tòxics.

- Protecció de les instal·lacions d'utilització mitjançant la posta a terra de les masses associat a dispositius de tall per corrents de defecte.

- Protecció contra sobrecàrregues i curtcircuit de línies mitjançant interruptors magnetotèrmics de les característiques adequades a cada circuit.

- Utilització d'interruptors diferencials d'alta sensibilitat per a la protecció contra xoc elèctric o contactes indirectes en les instal·lacions a l'abast de persones.

- Dotar a les diverses dependències d'un nivell d'il·luminació adequat en qualitat i quantitat suficient que permeti a les persones un eficaç i còmode desenvolupament de les seves funcions.

- Dotar a les diverses dependències d'endolls adequats en qualitat i quantitat suficient que permeti a les persones un eficaç i còmode desenvolupament de les seves funcions.

## ESCOMESA

L'escomesa es fa nova, consta d'un EM de TMF-01 i una CGP de 100, per a una potència del Q.G.D. de 42.656 W, amb IGA i ICP de 63 A.

L'escomesa del bar es nova, consta d'una CPM de CPM-MF-4, per a una potència del Q.G.D.B. de 4.299 W, amb IGA i ICP de 7,5 A.

## LÍNIES DE DISTRIBUCIÓ

No s'han previst derivacions com a tals, ja que la instal·lació és radial, partint del quadre general de distribució , amb cable de conductor de coure de 0,6/1 kV de tensió assignada, amb designació RZ1-K (AS).

## CANALITZACIONS

Els circuits principals discorreran per:

- Tub flexible corrugat de PVC aïllant i no propagador de la flama, resistència a l'impacte d'1 J, resistència a compressió de 320 N i una rigidesa dielèctrica de 2000 V, muntat sobre sostremort, si és soterrat.

- Tub rígid de PVC, de 25 mil·límetres de diàmetre nominal, aïllant i no propagador de la flama, resistència a l'impacte d'2 J, resistència a compressió de 1.200 N i una rigidesa dielèctrica de 2000 V, unió endollada i muntat superficialment.

En qualsevol cas, es seguiran estrictament les especificacions de la instrucció MI BT 019 en tots els seus apartats i capítols que li son d'aplicació.

Pel que fa a les entrades i sortides de circuits dels quadres, armaris, caixes de derivació i els propis receptors, s'efectuaran amb elements i accessoris de reconeguda qualitat i eficàcia que garanteixin en tot moment que les instal·lacions ofereixin un grau de protecció adequat.

## PROTECCIÓ DE LES INSTAL·LACIONS

### POSADA A TERRA

Per la posada a terra es complirà la instrucció MI BT 039 en tots els seus capítols.

Tots els elements metàl·lics, com les dutxes exteriors, columnes d'il·luminació, escales de piscina i suports salvavides, es connectaran a la nova xarxa de terra.

### CONDUCTORS DE PROTECCIÓ

Uniran les masses de les màquines i els seus envoltants, així com les parts metàl·liques no sotmeses a tensió dels equips d'enllumenat, a la línia principal de terra, ubicada al nou quadre general de distribució Q.G.D.

Les seccions compliran la instrucció MI BT 017, taula V i seran de prou secció perquè s'ajusti a la instrucció ME BT 039, capítol 8.1.a.

La protecció contra sobreintensitats degudes a sobrecàrregues en les línies, defectes d'aïllament de gran impedància i curtcircuits, s'ha realitzat mitjançant la utilització d'interruptors automàtics magnetotèrmics i/o fusibles instal·lats a l'inici de cada circuit, i en aquells punts en els que la intensitat admissible disminueixi per canvis de secció en els conductors; condicions d'instal·lació, sistema d'execució o tipus de conductors utilitzats, segons els esquemes unifilars de les instal·lacions que s'inclouen més endavant i en els plànols del projecte de la instal·lació i les seves característiques (intensitat nominal, corbes d'intensitat - temps, poder de tall etc.).

Les derivacions de la soldadura aluminotèrmica seran de cable de coure nu de 35 $mm^2$ de secció i la el traçat principal de coure nu de 50 $mm^2$ de secció. Es dotarà del circuit de piquetes d'ànima d'acer recoberta amb 300 micres de coure i de 2 meres de longitud i 14 mil·límetres de diàmetre de la marca: KLK o equivalent. El connexionat amb el Q.G.D. s'introduirà un pont de comprovació.

### PROTECCIÓ CONTRA CONTACTES DIRECTES

La protecció contra contactes directes de les parts actives de la instal·lació s'ha realitzat mitjançant recobriment aïllant apropiat, tubs protectors, caixes, envoltants de quadres, llumeneres i interposició d'obstacles d'allunyament de tal manera que cap punt de la instal·lació en tensió sigui accessible directament a persones, necessitant eines determinades. Els conductors de les línies generals i derivacions seran conductor de coure de 0,6/1 kV de tensió assignada, amb designació RZ1-K (AS+)

## PROTECCIÓ CONTRA CONTACTES INDIRECTES

La protecció contra contactes indirectes es realitza mitjançant interruptors diferencials, associats a la xarxa de terres descrita anteriorment, els quals són sensibles a la corrent de defecte.

El seu ús és apropiat ja que la xarxa d'alimentació de l'empresa subministradora d'energia és amb el neutre connectat a terra.

## PROTECCIÓ CONTRA SOBRECÀRREGUES I CURTCIRCUITS

En el quadre general de maniobra i control descrit anteriorment, s'indica el interruptor magnetotèrmic general de tall omnipolar, dotat de desconnexió magnetotèrmica. A més, totes les derivacions es protegeixen segons la instrucció MI BT 020, capítols 1.1, 1.2 i 1.3.

## MI.6 INSTAL·LACIÓ DE VENTILACIÓ

### OBJECTE

La instal·lació de ventilació té com a objecte l'extracció de l'aire humit generat a la zona de les dutxes de cada vestuari per a un confort òptim a l'interior de cada volumetria.

### ANTECEDENTS

Donat a que es un nou edifici, no hi ha instal·lació de ventilació.

### DESCRIPCIÓ DE L'ACTUACIÓ

Per a la correcta realització de la ventilació, s'instal·larà un ventilador axial al fals sostre de l'accés a la piscina de cada vestidor per tal de poder extreure correctament l'aire humit de la zona de les dutxes. Es realitzarà amb conductes de xapa d'acer galvanitzat cilíndrica amb elements terminals reixetes d'extracció, una per a cada dutxa, i a la façana contrària a la porta una reixeta d'impulsió de l'aire interior.

### UNIFORMITAT

Les cinc condicions bàsiques que cal complir en qualsevol instal·lació (temperatura, humitat relativa, puresa de l'aire velocitat i renovació de l'aire) seran idèntiques en tots els punts de l'estança.

### TEMPERATURA DE L'AIRE

Tant a l'hivern com a l'estiu la temperatura interior estarà en relació amb l'exterior, tal i com s'ordena a la ITE. 02.2.1. Aquest paràmetre es mantindrà constant en la zona ocupada.

La temperatura serà uniforme a cada zona ocupada, entenent zona ocupada el que s'indica al RITE, no admetent-se diferències simultànies de més de 1 °C.

### HUMITAT RELATIVA

El nivell màxim d'humitat relativa interior estarà en relació amb la temperatura, segons indica el Reglament d'Instal·lacions Tèrmiques en els Edificis.

Per a evitar els efectes de l'electricitat estàtica, mai haurà de baixar de 45 %.

### PURESA

L'aire impulsat a l'interior de l'edifici haurà d'estar filtrat, no contenint partícules superiors a la mida determinat per les normatives U.N.E. en relació a l'ús que ha de tenir el recinte.

### VELOCITAT RESIDUAL DE L'AIRE

Seguint el Reglament d'Instal·lacions Tèrmiques en els Edificis, la velocitat de l'aire no superarà un valor de 0,25 metres / segon, en zones susceptibles de ser ocupades per l'usuari.

## PARÀMETRES DE BENESTAR I HIGIENE

Amb la intenció d'assegurar un bon confort pels usuaris, i seguint la instrucció tècnica de disseny i dimensionat establerta pel Reglament d'Instal·lacions Tèrmiques en Edificis, en endavant RITE, s'han pres els següents criteris.

### Exigència de qualitat tèrmica de l'ambient

Temperatura operativa i humitat relativa.

Les condicions de temperatura i humitat s'han comentat a l'apartat anterior.

### Exigència de qualitat de l'aire interior

Categories de qualitat de l'aire interior en funció de l'ús dels edificis.

Cabal mínim d'aire de ventilació:

El cabal mínim d'aire de ventilació per als espais que formen part d'aquest projecte es calcula segons un dels 5 mètodes proposats pel RITE (A, B, C, D o E).

En el cas que ens ocupa s'ha triat el mètode A mètode indirecte de cabal d'aire exterior per persona i el mètode D mètode indirecte de cabal d'aire exterior per unitat de superfície.

Aquests mètodes estableixen uns valors mínims d'aire de ventilació segons quina sigui la categoria de qualitat de l'aire, definida a l'apartat anterior.

Segons s'indica a la taula següent, al tractar-se d'un espai de piscines, es considera un aire del tipus IDA2.

| Categoria | Descripció | Ús |
|---|---|---|
| IDA 1 | Aire d'òptima qualitat | Hospitals, clíniques, laboratoris i guarderies |
| IDA 2 | Aire de bona qualitat | Oficines, residències d'avis i estudiants, sales de lectura, museus sales de tribunals aules d'ensenyament i assimilables i piscines |
| IDA 3 | Aire de qualitat mitja | Edifici comercials, cinemes, teatres, salons d'actes ,habitacions d'hotels i similars, restaurants, cafeteries, bars, sales de festes, gimnasos, locals per esports (excepte piscines) i sales d'ordinadors |
| IDA 4 | Aire de qualitat baixa | |

Per tant el cabal d'aire exterior mínim haurà de ser de 12,5 $dm^3/s$ per persona en IDA 2:

| Categoria | Descripció | l/s per persona |
|---|---|---|
| IDA 1 | Aire d'òptima qualitat | 20,0 |
| IDA 2 | Aire de bona qualitat | 12,5 |
| IDA 3 | Aire de qualitat mitja | 8,0 |
| IDA 4 | Aire de qualitat baixa | 5,0 |

### Qualitat d'aire exterior

Al tractar-se d'un edifici situat en un entorn urbà, segon s'indica a la taula següent, es considera que la qualitat de l'aire exterior és ODA 2: aire amb altes concentracions de partícules.

| Categoria | Descripció |
|---|---|
| ODA 1 | Aire pur que pot contenir partícules sòlides (per exemple pol·len) de forma temporal |
| ODA 2 | Aire amb altes concentracions de partícules |
| ODA 3 | Aire amb altes concentracions de contaminants gasosos |
| ODA 4 | Aire amb altes concentracions de contaminants gasosos i partícules |
| ODA 5 | Aire amb molt altes concentracions de contaminants gasosos i partícules |

### Filtratge

Segons la taula 1.4.2.5. Classes de filtració, per una qualitat d'aire exterior ODA 2 i una qualitat d'aire interior IDA 2, correspon una classificació F6+F8.

| | IDA 1 | IDA 2 | IDA 3 | IDA 4 |
|---|---|---|---|---|
| **ODA 1** | F9 | F8 | F7 | F5 |
| **ODA 2** | F7 + F9 | F6 + F8 | F5 + F7 | F5 + F6 |
| **ODA 3** | F7 + GF + F9 | F7 + GF + F9 | F5 + F7 | F5 + F6 |

### Aire d'extracció

El aire d'extracció es classifica d'acord amb les següents categories:

| Categoria | Nom | Descripció | Usos |
|---|---|---|---|
| AE 1 | Baix nivell de contaminació | Les emissions procedeixen dels materials de construcció i decoració, i de les persones | Oficines, aules, sales de reunions, locals comercials sense emissions específiques, espais d'ús públic, escales i passadissos |
| AE 2 | Moderat nivell de contaminació | Mas contaminants que la categoria anterior, i en què no es pot fumar | Restaurants, habitacions d'hotels, vestidors, bars, magatzems |
| AE 3 | Alt nivell de contaminació | Producció de productes químics, humitat, etc. | Lavabos, saunes, cuines, laboratoris químics, impremtes, habitacions fumadors |
| AE 4 | Molt alt nivell de contaminació | Substàncies oloroses i contaminants en concentració superior a la permesa en l'aire ANADA | Extracció de campanes de fums, aparcaments, locals de pintures i solvents, llenceria bruta, residus de menjar, fumadors, laboratoris químics |

El sistema de ventilació es troba dins de la categoria AE3 donat que es tracta d'un ús de dutxes i hi haurà humitat.

## EXIGÈNCIA DE QUALITAT DE L'AMBIENT ACÚSTIC

Les instal·lacions tèrmiques projectades i executades segons projecte compleixen l'exigència del document DB-HR Protecció front al soroll del Codi Tècnic de l'Edificació.

## DESCRIPCIÓ DE LES INSTAL·LACIONS

La instal·lació realitzada per aquest expedient, és d'un sistema per a cada vestidor d'un ventilador lineal amb connexions de conductes circulars vistos de xapa galvanitzada amb elements teminals reixetes.

S'ubicarà cada ventilador de cabal variable al fals sostre de la zona d'accés a la piscina i propera a les dutxes. Les reixetes d'extracció es situaran cadascuna sobre una dutxa per a una major eficiència del procés. Cada respectiva reixa d'impulsió s'ubicarà a la façana contrària a la porta.

## EXTRACCIÓ D'AIRE

La xarxa d'extracció es realitza segons la normativa indicada al RITE.

La impulsió i el retorn es troben constituïts per una xarxa de conductes vistos circulars d'acer galvanitzat. La impulsió extreu l'aire humit de les dutxes a l'exterior mitjançant una reixa lineal situada a la façana. Pel que fa al retorn, es disposa de reixes d'extracció lineals situades al conducte vist, com s'indica a la documentació gràfica.

L'extracció d'aire interior, com s'ha indicat anteriorment, es realitza a través de ventiladors de cabal variable lineal amb les següents característiques:

| Marca | Model | Número d'unitats | Cabal d'aire |
|---|---|---|---|
| | | | (m3/h) |
| SOLER & PALAU | TD-1000/200 SILENT ECOWATT CAV o equivalent | 2 | 450 |

A continuació s'indica la taula de renovació d'aire dels diferents espais.

PROJECTE: PISCINA EXTERIOR LLINARS DEL VALLÈS 23061

| Nº | Local | Tipus d'us | | Número de persones, locals, places d'aparcament o m2 | sala de fumadores | Aire Exterior m3/h | Categoria de la qualitat de l'aire | Classes de filtres |
|---|---|---|---|---|---|---|---|---|
| Vestuari 1 | Dutxes | 37 Aseos públics | Número de Lavabos | 5 | no | 450 | IDA 2 | F6/F8 |
| Vestuari 2 | Dutxes | 37 Aseos públics | Número de Lavabos | 5 | no | 450 | IDA 2 | F6/F8 |

## AÏLLAMENT DE XARXES DE CONDUCTES

Estanquitat en xarxes de conductes

L'estanquitat en la xarxa de conductes es determinarà per l'equació: $f=c \cdot p^{0,65}$ on,

- f representa les fuites d'aire en $dm^3/(s \cdot m^2)$
- p la pressió estàtica en Pa
- c defineix la classe d'estanquitat .

Les classes poden ser:

| Classe | Coeficient c |
|---|---|
| A | 0,027 |
| B | 0,009 |
| C | 0,003 |
| D | 0,001 |

Per les xarxes de conductes tan sols s'admet una classe d'estanquitat B o superior.

## REGULACIÓ I CONTROL

S'instal·la un rellotge horari per encendre o apagar remotament els ventiladors.

## INSONORITZACIÓ I VIBRACIONS

Es prendran les mesures adequades perquè no es produeixin nivells de pressió sonora alts.

Per tal de reduir al màxim la transmissió de vibracions de les instal·lacions mecàniques a l'estructura de l'edificació es dotarà a tots els elements mòbils de silent-blocks.

## REQUISITS DE SEGURETAT

Es tindran en compte totes les especificacions contemplades en el RITE.

## INSTAL·LACIÓ ELÈCTRICA

Donat que s'instal·larà un nou quadre general de distribució, l'alimentació elèctrica de les unitats de ventilació es realitzarà directament al nou QGD, sempre amb les proteccions adequades.

## MI.7 INSTAL·LACIÓ CONTRA INCENDIS

Donat que la superfície de l'edifici és inferior als 500 $m^2$, només es necessari dotar-lo d'extintors manuals per tal de cobrir totes les àrees de l'edifici. Alhora per cadascun d'aquests extintors també es col·locarà un rètol de senyalització d'instal·lació de protecció contra incendis. Al mateix temps s'instal·laran rètols de senyalització de sortida d'emergència en tots els recorreguts d'evacuació corresponents. Cada volumetria contindrà un extintor per dotar els espais d'elements contra incendis. A la volumetria del bar es situaran dos, un a dins de la cuina i l'altre a la sala d'instal·lacions, degut a la distància i comunicació entre ambdós espais.

## MN. NORMATIVA APLICABLE

En l'elaboració d'aquest projecte, s'ha tingut en compte tota la reglamentació vigent que figuren en les Ordenances Municipals de l'ajuntament de Barcelona, així com les corresponents a la legislació vigent, i en particular els següents reglaments:

### MN 1.Normativa d'àmbit estatal (Codi Tècnic de l'Edificació i altres reglaments)

• REIAL DECRET 314/2006, de 17 de març, pel que s'aprova el Codi Tècnic de l'Edificació (BOE núm. 74, 28/03/2006) i modificacions posteriors.

Article 11. Exigències bàsiques de seguretat en cas d'incendi (SI).

Article 12. Exigències bàsiques de seguretat d'utilització i accessibilitat (SUA).

Article 13. Exigències bàsiques de salubritat (HS).

Article 15. Exigències bàsiques d'estalvi d'energia (HE).

Article 14. Exigències bàsiques de protecció enfront al soroll (HR).

• Ordenança general de seguretat i higiene en el treball.

Ordre de 9 de març de 1971, del Ministeri de Treball (BOE núm. 64 i 65, 16/03/1971).I modificacions posteriors.

Llei 31/1995, de 8 novembre de la Direcció de l'Estat (BOE núm. 269, 10/11/1995).Modificada Llei 50/1998, de 30-12, de mesures fiscals, administratives i de l'ordre social (BOE núm. 313. 31-12-1998).

Disposicions mínimes de seguretat i salut en els llocs de treball.
Reial Decret 486/1997, de 14 d'abril, del Ministeri de Treball i Afers Socials (BOE núm. 97,23/04/1997).

Modificat per: Reial Decret 2177/2004, 12-11-2004 (BOE núm. 274. 13-11-2004)

S'estableixen disposicions mínimes de seguretat i de salut en les obres de construcció. Reial Decret 1627/1997, de 24 d'octubre, del Ministeri de la Presidència (BOE núm. 256,25/10/1997).

Modificat pel Reial Decret 2177/2004 i el Reial Decret 604/2006.

Modificació del Reial Decret 39/1997, de 17-01-1997, pel que s'aprova el Reglament dels Serveis de Prevenció, i del Reial Decret 1627/1997, de 24-10-1997, pel que s'estableixen les disposicions mínimes de seguretat i salut en les obres de construcció. Reial Decret 604/2006,de 19-05-2006 (BOE núm. 127, 29/05/2006)

Disposicions mínimes de seguretat i salut per a la utilització pels treballadors dels equips de treball.

Reial Decret 1215/1997, de 18 de juliol, del Ministeri de la Presidència (BOE núm. 188, 07/08/1997).

Reial Decret 2177/2004, de 2004.11.12, pel qual es modifica el Reial decret 1215/1997, de 18-07-1997, pel qual s'estableixen les disposicions mínimes de seguretat i salut per a la utilització pels treballadors dels equips de treball, en matèria de treballs temporals en altura.

Reial Decret 2177/2004, de 12 de novembre, (BOE núm. 274, 13/11/2004) pel que modifica el RD 1215/1997, en matèria de treballs temporals en altura.

Reial Decret 614/2001 de 08-06 sobre disposicions mínimes per a la protecció de la salut i seguretat dels treballadors en front al risc elèctric.

Reial Decret 286/2006 de 27-03 sobre protecció de la salut y la seguretat dels treballadors contra el riscs derivat de l'exposició al soroll. ( BOE núm 60, 11/03/2006)

Reial Decret 206/2006 de 10-03-2006 sobre protecció dels treballadors front als risc derivats de l'exposició al soroll durant la feina.

Reial Decret 773/1997 de 30-05-1997 sobre disposicions mínimes de seguretat i salut relatives a la utilització por els treballadors d'equips de protecció individual (EPIs).

Reial Decret 286/2006 de 10-03 sobre protecció de la salut i la seguretat dels treballador contra los riscs relacionats amb l'exposició al soroll.

Normes UNE citades en les normatives i reglamentacions.

Normes Tecnològiques de l'Edificació, del Ministeri d'obres Públicas i Urbanisme, en lo que no contradigui els reglaments o CTE.

INSTAL•LACIÓ DE FONTANERIA

La normativa vigent a seguir per la instal·lacions de subministrament d'aigua és:
Instal·lació de fontaneria:

- Reglamentació i instruccions Tècniques RITE, segons Real Decret 2007.
- Codi Tècnic de l'Edificació (CTE)
- Decret d'eco eficiència
- Ordenança Medi Ambient de Barcelona, modificada a 25 de febrer de 2011.

Els tubs de polipropilè, rodons estirats en calent, seguiran les normatives UNE, en quant a toleràncies, característiques mecàniques i condicions tècniques de subministrament.

INSTAL·LACIÓ DE VENTILACIÓ

Per a la confecció del present projecte s'han seguit les següents normatives i reglamentacions:

- Codi Tècnic de l'Edificació.
- Reglament de Instal·lacions Tèrmiques als Edificis (RITE)
- Reial decret 1829/2009 pel que es modifica el RITE
- Reial decret 178/2021 pel que es modifica el RITE
- Reglament d'Aparells a Pressió, i Instruccions Tècniques complementaries. RD 1.244/79.
- Reglament de Seguretat per a Plantes i Instal·lacions Frigorífiques i les seves Instruccions Tècniques complementàries.
- Normes UNE d'obligat compliment.
- Recomanacions de les Entitats d'Inspecció i Control (EIC).
- Ordenança General de Seguretat i Higiene en el treball.
- Recomanacions de les Companyies Subministradores.
- Aïllaments tèrmics, acústics i antivibratoris.
- Reglament i Instruccions Tècniques de les Instal·lacions de Calefacció, Climatització i Aigua Calenta Sanitària.
- Reglament d'Activitats Molestes, Insalubres, Nocives i Perilloses, Decret de 30 de Novembre de 1.961.
- Ordenança Municipal per a la protecció del Medi Ambient contra les pertorbacions per sorolls i vibracions.
- Norma Tecnològica de l'Edificació, Instal·lació i Climatització individual.
- Reial Decret 486/1997, de 14 d'abril, del Ministeri de Treball i Afers Socials (BOE núm. 97,23/04/1997). Disposicions mínimes de seguretat i salut en els llocs de treball.
- Guia Tècnica de l'INSHT per a l'avaluació i prevenció dels riscos relatius a la utilització de llocs de treball ( Reial Decret 486/1997).

INSTAL•LACIÓ ELÈCTRICA
Per a la confecció d'aquest projecte s'ha seguit les següent normes i reglamentacions:

- Reglament Electrotècnic de Baixa Tensió DE 2002 i Instruccions Complementaries.
- Normes UNE d'obligat compliment
- Recomanacions de las entitats d'inspeccions i control EIC
- Ordenança General de Seguretat i Higiene en el Treball
- Recomanacions de la Companyia Elèctrica
- Acolliment a la normativa 10/2005

CONTRA INCENDIS

- CTE: DB-SI - Codi tècnic de l'edificació.
- Reial Decret 513/2017, de 22 de Maig, pel que s'aprova el Reglament d'instal·lacions de protecció contra incendis. (RIPCI).
- Decret 239/1999, que aprova el catàleg dels espectacles, les activitats recreatives i els establiments públics.
- Reial Decret 865/2003, de 4 de juliol sobre els criteris higienicosanitaris per a la prevenció i control de la legionel·losi.
- Reial Decret 140/2003 sobre criteris sanitaris de la qualitat de l'aigua de consum humà
- Decret 95/2000 de 22 de febrer sobre normes sanitàries aplicades a piscines d'ús públic
- Decret 165/2001 de 12 de juny de modificació del Decret 95/2000.
- Decret 352/2004 de 27 de juliol sobre els criteris higienicosanitaris per a la prevenció i control de la legionel·losi
- Reial Decret 2816/1982, d'agost pel que s'aprova el Reglament General de Policia sobre Espectacles públics i activitats recreatives.
- Reglament electrotècnic de Baixa Tensió, i els annexos publicats en setembre del 2003.
- Normes Bàsiques de l'Edificació en edificis habitats.
- Reglament de les Instal·lacions tèrmiques dels edificis.
- Decret 165/2001 del 12 de juny de modificació del Decret 95/2000.
- Llei 3/2010, del 18 de febrer, de prevenció i seguretat en matèria d'incendis en establiments, activitats, infraestructures i edificis.
- Real Decret 732/2019, de 17 de març, pel que s'aprova el Codi Tecnic de l'Edificació.

Normatives d'àmbit autonòmic

- DECRET 135/1995, de 24 de març, de desplegament de la Llei 20/1991, de 25 de novembre, de promoció de l'accessibilitat i de supressió de barreres arquitectòniques, i d'aprovació del Codi d'accessibilitat.
- Decret 352/2004 de 27 de juliol sobre els criteris higienicosanitaris per a la prevenció i control de la legionel·losi.
- DECRET 32/2006, de 9 de gener, pel qual s'aprova el Catàleg de Residus de Catalunya.
- DECRET 176/2009 de 10 de novembre, pel qual s'aprova la Llei 16/2002 de 28 de Juny, de protecció contra la contaminació acústica, i se n'adapten els annexos.
- LLEI 20/2009, de 4 de desembre , de prevenció i control ambiental de les activitats.

## TERMINI D'EXECUCIÓ I PLANIFICACIÓ DE L'OBRA

El termini d'execució de les obres objecte del present projecte s'estima en SIS MESOS.

El termini d'execució s'iniciarà amb data de signatura de l'Acta de Replanteig i d'Inici d'obra.

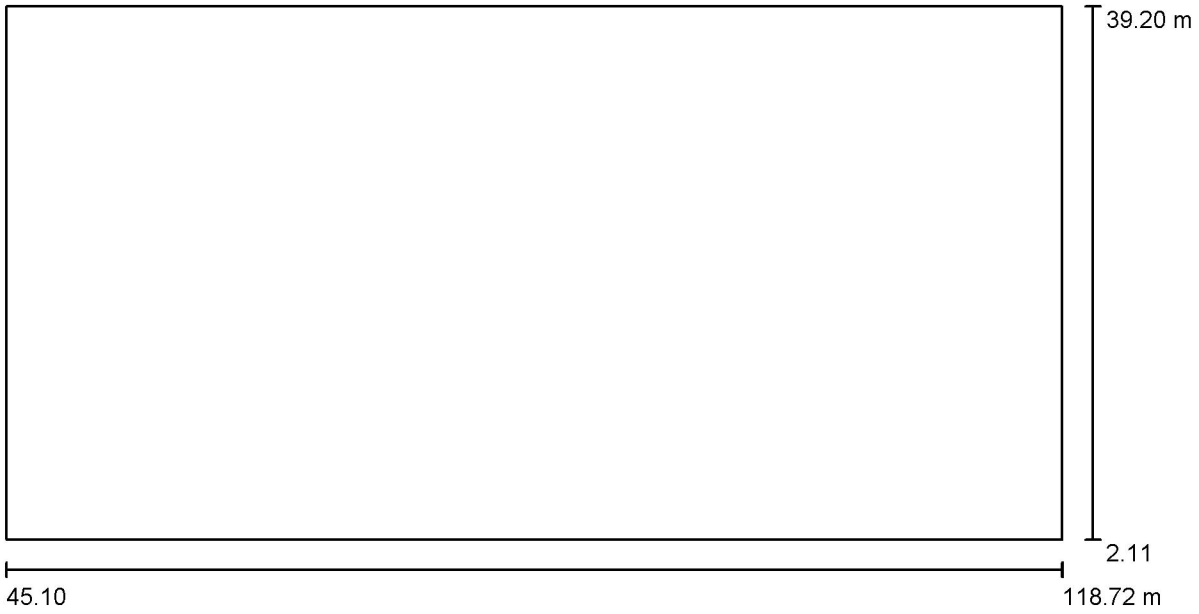
# GEWISS GWF1100ZC830 ELIA FL XL3 200W 830 Asym. On/Off / Hoja de datos de luminarias

Dispone de una imagen de la luminaria en nuestro catálogo de luminarias.

Emisión de luz 1:



Clasificación luminarias según CIE: 100
Código CIE Flux: 41 82 98 100 100

Para esta luminaria no puede presentarse ninguna tabla UGR porque carece de atributos de simetría.

# 2. ESFUERZOS EN NUDOS DE LOSAS Y RETICULARES

Cortantes en Tm. Momentos en Tm.x m.

Coord. X y Coord. Y son coordenadas generales. Los esfuerzos están referidos a los ejes locales de la malla correspondiente.

Envolventes de esfuerzos mayorados

Cimentación
